## ECE 320 - Homework \#8

## DTL, TTL Logic, MOSFET theory. Due Monday, October 19th

## DTL NOR Gate

1) Determine the voltages and currents for the following DTL OR gate

2) Simulate this circuit in CircuitLab to verify your answers for problem \#1

## DTL NAND Gate: Open Collector Logic

The following circuit uses a DTL NAND gate to turn on a speaker when

- The output of a 555 timer is high $(\mathrm{V} 1=5 \mathrm{~V})$, and
- The output of a comparitor is high $(\mathrm{V} 2=5 \mathrm{~V})$

The output is conencted directly to the collector of the transistor
3) Determine the voltage V3 and current I3 when

- $\mathrm{V} 1=0 \mathrm{~V}$
- $\mathrm{V} 2=$ any

Case 2:

- $\mathrm{V} 1=\mathrm{V} 2=5 \mathrm{~V}$

4) Simulate this circuit for $1 / 30 \mathrm{~ms}$ in CircuitLab with

- $\mathrm{V} 1=600 \mathrm{~Hz}$ clock signal $(0 \mathrm{~V} / 5 \mathrm{~V}$ square wave $)$
- $\mathrm{V} 2=60 \mathrm{~Hz}$ clock signal $(0 \mathrm{~V} / 5 \mathrm{~V})$

Current through the Speaker: I(R2)

## Lab (include a photo to receive credit)

5) Build this circuit and measure the voltage you see at V3 for each case

Case 1: 0 V applied to diode \#2

- The transistor is always off
- $\mathrm{Vc}=5 \mathrm{~V}$ (transistor is off)

Case 2: 5 V applied to diode \#2

- $\mathrm{Vc}=5 \mathrm{~V}$ when the 555 timer outputs 0 V (transistor off)
- $\mathrm{Vc}=1.2 \mathrm{~V}$ when the 555 timer outputs 5 V (transistor is active mode)

Apparently, the current gain is less than 100 and I need more base current

$$
\begin{aligned}
& I_{c}=\left(\frac{5 V-1.2 \mathrm{~V}}{28 \Omega}\right)=136 \mathrm{~mA} \\
& I_{b}=\left(\frac{5 V-0.7 \mathrm{~V}}{1 k}\right)=4.3 \mathrm{~mA} \\
& \beta=\frac{I_{c}}{I_{b}}=\frac{136 \mathrm{~mA}}{4.3 \mathrm{~mA}}=31.6
\end{aligned}
$$

6) Build this circuit using

- The 555 timer from homework set \#5 for V1, and
- Connecting theThe comparitor from homework set \#5 for V2

Verify that

- The speaker turns on when $\mathrm{T}>$ Ton and
- The speaker turns off when $\mathrm{T}<$ Ton

Setting the comparitor to turn on at 1.80 V

- Speaker turns on when $\mathrm{Vr}<1.80 \mathrm{~V}$
- Speaker turns off when $\mathrm{Vr}>1.83 \mathrm{~V}$

Measuring the voltage where the speaker turns on and off

## TTL Logic

7) Determine the voltages for the following TTL inverter. Assume

- 3904 transistors.
- Current gain $=0.1$ when used backwards

8) Simulate these circuits in CircuitLab and determine the voltage and currents

Case 1: 0 V in produces 5 V out (actually 4.545 V due to loading)

Case 2: 5 V in produces 0 V out ( 22.58 mV actually) note: $\mathrm{Ic}=4 \mathrm{Ib}$. Q1 has a gain of 4.00 when used backwards

## MOSFET

9) The VI characteristics for an n-channel MOSFET is shown on the following page. Assume Vth $=1.0 \mathrm{~V}$

- Determine the transconductance gain, kn
- Label the off / saturated / ohmic regions in the curve below.
kn: Point A (Ohmic region)

$$
\begin{aligned}
& I_{d s}=k_{n}\left(V_{g s}-V_{t h}-\frac{V_{d s}}{2}\right) V_{d s} \\
& 4 m A=k_{n}\left(5 V-1 V-\frac{2 V}{2}\right) 2 V \\
& k_{n}=666.7 \frac{\mu A}{V^{2}}
\end{aligned}
$$

Point B (Saturated Region)

$$
\begin{aligned}
& I_{d s}=\frac{k_{n}}{2}\left(V_{g s}-V_{t h}\right)^{2} \\
& 8.1 m A=\frac{k_{n}}{2}(6 V-1 V)^{2} \\
& k_{n}=648 \frac{\mu A}{V^{2}}
\end{aligned}
$$

The two answers should be the same (errors in reading the graph result in the slight difference)

10) Draw the load line and mark the operating points for $\mathrm{Vg}=\{0 \mathrm{~V}, 4 \mathrm{~V}, 7 \mathrm{~V}\}$ (change R to 1000 Ohms. Otherwise it's off the chart)

0V:

- $\mathrm{Vds}=10 \mathrm{~V}$
- $\mathrm{Ids}=0 \mathrm{~V}$
- Off region

4V:

- $\mathrm{Vds}=7 \mathrm{~V}$
- Ids = 3mA
- Saturated Region

7V:

- $\mathrm{Vds}=2.3 \mathrm{~V}$
- Ids $=7.5 \mathrm{~mA}$
- Ohmic Region
