## ECE 320-Quiz \#3 - Name

Ideal Diodes, LEDs, AC to DC Converters - Spring 2022

1) Determine the voltages and currents for the following circuit. Assume

- R is $900+100^{*}$ (your birth month) + (your birthday). For example, May $14=1414$ Ohms)

| $\underset{\substack{\text { 900 toormo tay }}}{\mathrm{R}}$ | $\mathrm{v}_{1}$ | 12 | ${ }^{13}$ | 14 | 15 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1414 | 0.7 V | 6.577 mA | 0 | 0 | 6.577 mA |

$$
I_{2}=\left(\frac{10 V-0.7 V}{1414 \Omega}\right)=6.577 \mathrm{~mA}
$$

2) Determine the voltages and currents for the following circuit. Assume

- Ideal green LEDs $(\mathrm{Vf}=3.0 \mathrm{~V})$.
- R is $900+100^{*}$ (your birth month) + (your birthday).

| V 1 V | V 2 | V 3 | Id 1 | Id 2 | Id 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 4.555 V | 1.555 V | 3.0 V | 0.778 mA | 0 | 1.555 mA |

If all three diodes are on

$$
\mathrm{V} 3=3 \mathrm{~V}, \mathrm{~V} 2=6 \mathrm{~V}, \mathrm{~V} 1=9 \mathrm{~V}
$$

Current in doesn't match current out

$$
\begin{aligned}
& \text { Current in }=\left(\frac{10 V-9 V}{1414 \Omega}\right)=707 \mu A \\
& \text { Current Out }=\left(\frac{9 V}{3 k \Omega}\right)+\ldots=3 m A+\ldots
\end{aligned}
$$

At least one diode is off.

- If $\mathrm{V} 0=0 \mathrm{~V}$, all three diodes are off
- Once V1 rises above 3V, Diode 1 turns on and Diode 3 turns on
- Assume diodes 1 and 3 are on

V1 is then

$$
\left(\frac{V_{1}-10}{1414}\right)+\left(\frac{V_{1}-3}{1000}\right)+\left(\frac{V_{1}}{3000}\right)+\left(\frac{V_{1}-3}{2000}\right)=0
$$

$$
V_{1}=4.555 \mathrm{~V}
$$

3) A green and white LED are connected to a 10 V source. Determine the current and brighness of each LED. Assume

- R is $900+100$ (your birth month) + (your birthday).
- 3W LED: Vf=3.6V @ 750mA 180 Lumens @ 750mA
- 10W LED $\quad \mathrm{Vf}=11.0 \mathrm{~V} @ 1000 \mathrm{~mA} \quad 650$ Lumens @ 1000 mA

| $\stackrel{\mathrm{R}^{\mathrm{R}}}{900+100^{\mathrm{m}}+\mathrm{day}}$ | 3W LED |  | 10W LED |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Ia | Lumens | Ib | Lumens |
| 1414 | 8.568 mA | 2.056 | 3.728 mA | 2.423 |

$I_{a}=\left(\frac{20-3.6}{1414+500}\right)=8.568 m A$
$\left(\frac{8.568 \mathrm{~mA}}{750 \mathrm{~mA}}\right) 180$ Lumens $=2.056$ Lumens
$I_{b}=\left(\frac{20 \mathrm{~V}-11.0 \mathrm{~V}}{1414 \Omega+1000 \Omega}\right)=3.728 \mathrm{~mA}$
$\left(\frac{3.728 \mathrm{~mA}}{1000 \mathrm{~mA}}\right) 650$ Lumens $=2.423$ Lumens
4) The following waveform is found using CircuitLab for an AC to DC converter. Determine the following

| Frequency (Hz) | V 2 |  |
| :---: | :---: | :---: |
|  | DC (average) | AC (Vpp) |
| 400 Hz | 13.87 V | 370 mVpp |

5) Determine the voltages V1 and V2 (both DC and AC). Assume

- Ideal silicon didoes $(\mathrm{Vf}=0.7 \mathrm{~V})$
- $\mathrm{C} 1=\left(900+100^{*}(\right.$ your birth month $)+($ your birthday $\left.)\right) u F$.

| $\mathrm{C} 1(\mathrm{uF)})$ <br> $900+100^{2} \mathrm{~m}+$ day | V 1 |  | V 2 |  |
| :---: | :---: | :---: | :---: | :---: |
| $\mathbf{1 4 1 4 u F}$ | $\mathbf{1 7 . 6 8 V}$ | $\mathbf{3 . 2 5 0 V}(\mathrm{Vlpp})$ | DC | $\mathrm{AC}(\mathrm{V} 2 \mathrm{pp})$ |

$$
\max \left(V_{1}\right)=19.3 V
$$

$$
I \approx\left(\frac{19.3 \mathrm{~V}}{70 \Omega}\right)=275.7 m A \quad \text { worst case }
$$

$$
I=C \cdot \frac{d V}{d t}
$$

$$
275.7 m A=1414 \mu F \cdot \frac{d V}{1 / 60 s}
$$

$$
d V=3.250 V_{p p}=V_{1}(A C)
$$

$$
V_{1}(D C)=19.3 V-\frac{1}{2} V_{1}(A C)=17.68 V
$$

$$
V_{2}(D C)=\left(\frac{60}{60+10}\right) V_{1}(D C)=15.154 V
$$

$$
V_{2}(A C)=\left(\frac{(9.809-j 22.189)}{(9.809-j 22.189)+(10+j 150.8)}\right) V_{1}(A C)
$$

$$
V_{2}(A C)=0.606 V_{p p}
$$

6) Determine C 1 , and C 2 so that

- The ripple at V 1 is 4 Vpp and
- The ripple at $\mathrm{V} 2=500 \mathrm{mV} \mathrm{pp}$

| C 1 | C 2 |
| :---: | :---: |
| 1030 uF | 127.6 uF |

$$
\begin{aligned}
& V_{1}(D C)=19.3 \mathrm{~V}-\frac{1}{2} \cdot 4 V_{p p}=17.3 \mathrm{~V} \\
& I=\left(\frac{17.3 \mathrm{~V}}{70 \Omega}\right)=247 \mathrm{~mA}
\end{aligned}
$$

$$
247 m A=C_{1} \cdot \frac{4 V}{1 / 60 s}
$$

$$
C_{1}=1030 \mu F
$$

Assume $\mathrm{C} 2=0$

$$
\begin{aligned}
& V_{2}(A C)=\left(\frac{60}{60+(10+j 150.8)}\right) 4 V_{p p}=1.444 V_{p p} \\
& \left|\frac{1}{j \omega C_{2}}\right|=\left(\frac{0.5 V_{p p}}{1.444 V_{p p}}\right) 60 \Omega=20.782 \Omega \\
& C_{2}=127.6 \mu F
\end{aligned}
$$
