## Calculating Probabilities

If all outcomes are equally likely, you can calculate probabilities using enumeration

- Convolution is one way of enumeration all possibilities
- If you measure everything you produce, you know what your product is
- You also are broke since you have no product to sell

If you know the mean and standard deviation,

- Assume a normal distribution (Central Limit Theorem)
- Calculate z-scores & probabilities
- Requires no measurements

If you do not know the mean and standard deviation,

- Assume a normal distribution (Central Limit Theorem)
  - Collect data and estimate the mean and standard deviation (small sample size)
  - The resulting distribution is a Student-t distribution
  - Similar to a normal distribution, but takes sample size into account
-

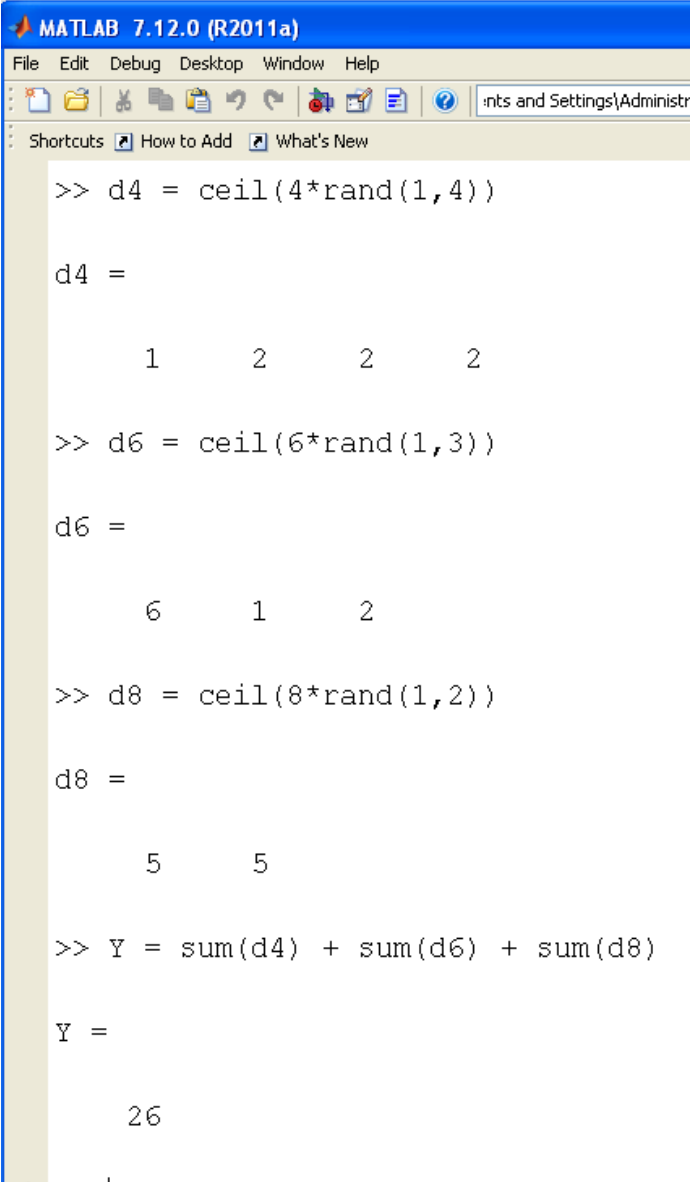

## Example: Dice

Let

$$Y = 4d4 + 3d6 + 2d8$$

Determine the probability:

- $p(y = 35)$
- $p(y > 35)$
- The 90% confidence interval (5% tails)

```
MATLAB 7.12.0 (R2011a)
File Edit Debug Desktop Window Help
Shortcuts How to Add What's New

>> d4 = ceil(4*rand(1,4))

d4 =

     1     2     2     2

>> d6 = ceil(6*rand(1,3))

d6 =

     6     1     2

>> d8 = ceil(8*rand(1,2))

d8 =

     5     5

>> Y = sum(d4) + sum(d6) + sum(d8)

Y =

    26
```

## Solution #1: Enumeration

- $Y = 4d4 + 3d6 + 2d8$

Test every possible outcome

- Nested for-loops works
- Convolution works

```
Editor - C:\Documents and Settings\Administrator\My Documents\WA
File Edit Text Go Cell Tools Debug Desktop Window Help
+ - 1.0 + ÷ 1.1 x % %
1 - d4 = [0,1,1,1,1]' / 4;
2 - d6 = [0,1,1,1,1,1,1]' / 6;
3 - d8 = [0,1,1,1,1,1,1,1,1]' / 8;
4 - d42 = conv(d4,d4);
5 - d44 = conv(d42,d42);
6 - d62 = conv(d6,d6);
7 - d63 = conv(d6,d62);
8 - d82 = conv(d8,d8);
9 - d4d6 = conv(d44,d63);
10 - Y = conv(d4d6,d82);
11 - bar(Y)
```

# Enumeration Results

- Results are exact (good)
- $p(y=35) = 4.4445\%$
- $p(y \geq 35) = 15.8524\%$
- 90% confidence interval:  $21.5 < y < 38.5$

## Problem with enumeration:

- All 3,538,944 outcomes tested
- If each test costs \$10, that's \$35 million

## Solution #2: Monte-Carlo

Roll the dice 100,000 times

Record the frequency of each result

### Matlab Code

```
RESULT = zeros(52,1);  
for n=1:1e5  
    d4 = ceil(4*rand(1,4));  
    d6 = ceil(6*rand(1,3));  
    d8 = ceil(8*rand(1,2));  
    Y = sum(d4) + sum(d6) + sum(d8);  
    RESULT(Y) = RESULT(Y) + 1;  
end  
bar(RESULT)
```

# Monte-Carlo Results

$$p(y = 35) = 4.444\%$$

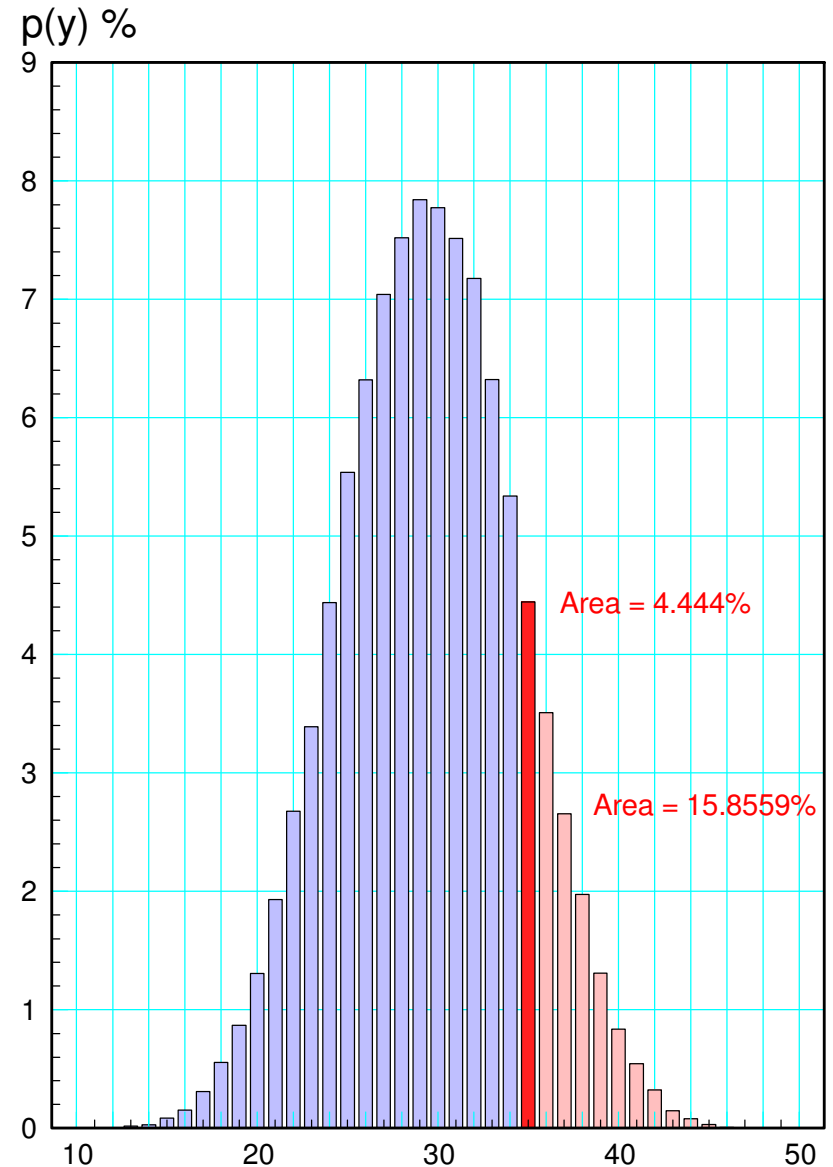

- exact = 4.4445%

$$p(y \geq 35) = 15.859\%$$

- exact = 15.8524%

90% confidence interval:  $20.5 < y < 38.5$

- $21.5 < y < 38.5$

---

## Problem with Monte-Carlo Simulations

### Expense

- If it costs \$10 for each experiment, 100,000 samples = \$1 million

### Time

- If it takes 10 minutes to measure each  $y$ , 100,000 samples = 1.9 years

Can you come up with the same results using fewer measurements?

- Yes
  - Requires statistics
-

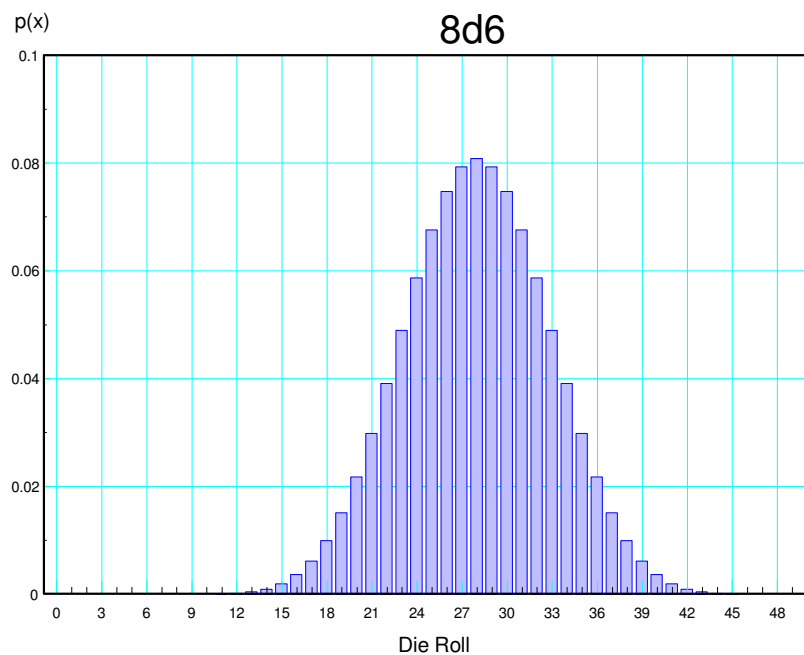

---

# Central Limit Theorem

- All distributions converge to a normal distribution
- Normal + Normal = Normal
- Once you have a normal distribution, you remain with a normal distribution.

For example, 1d6 (not normal) vs. 8d6 (approx normal)

---

## Normal (Gaussian) Distributions:

$$N(\bar{x}, \sigma^2)$$

$$p(x) = \frac{1}{\sqrt{2\pi\sigma^2}} \cdot \exp\left(\frac{-(x-\bar{x})^2}{2\sigma^2}\right)$$

Standard Normal Distribution (normalized so the peak is 1.000)

---

# Properties of Normal Distributions

Two parameters define a normal distribution

- Mean
- Standard Deviation (or Variance)

Mean: average of the data

$$\mu = \frac{1}{n} \sum y_i$$

Variance: average squared distance to mean

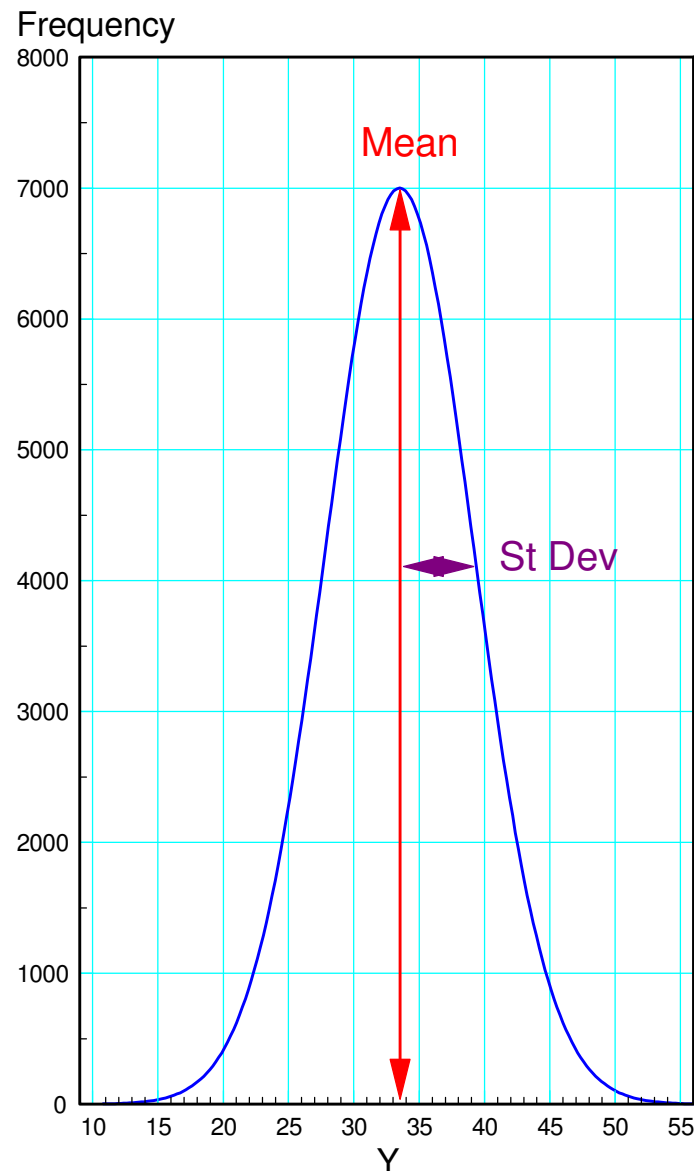

$$\sigma^2 = \frac{1}{n} \sum (y_i - \mu)^2$$

Standard Deviation (spread)

$$\sigma = \sqrt{\sigma^2}$$

When you add normal distributions

- The means add
- The variances add

---

## Example: Dice

### The mean and variance for a 4-sided die

```
>> d4 = [1, 2, 3, 4];  
>> m4 = sum(d4) / 4  
      m4 =      2.5000  
>> v4 = sum( (d4 - m4).^2 )/4  
      v4 =      1.2500
```

### The mean and variance for a 6-sided die

```
>> d6 = [1, 2, 3, 4, 5, 6];  
>> m6 = sum(d6) / 6  
      m6 =      3.5000  
>> v6 = sum( (d6 - m6).^2 )/6  
      v6 =      2.9167
```

### The mean and variance for an 8-sided die

```
>> m8 = sum(d8) / 8  
m8 =      4.5000  
>> v8 = sum( (d8 - m8).^2 )/8  
v8 =      5.2500
```

---

## 4d4 + 3d6 + 2d8

- The means add
- The variances add

```
>> my = 4*m4 + 3*m6 + 2*m8  
my = 29.5000
```

```
>> vy = 4*v4 + 3*v6 + 2*v8  
vy = 24.2501
```

```
>> sy = sqrt(vy)  
sy = 4.9244
```

### To plot the normal pdf

```
s = [-4:0.01:4]';  
p = exp(-s.^2 / 2);  
plot(s*sy+my,p*7000);  
xlabel('Die Roll')
```

Central Limit Theorem in action...

## What is the probability of $y = 35$ ?

- $p(34.5 < y < 35.5)$

### Calculate the z-score

- how far  $y$  is from the mean

$$z_1 = \left( \frac{34.5 - \mu}{\sigma} \right)$$

```
>> z1 = (34.5 - my) / sy
z1 = 1.0153
p(y > 34.5) = 15.498% (from StatTrek)
```

```
>> z2 = (35.5 - my) / sy
z2 = 1.2184
p(y > 35.5) = 11.154% (from StatTrek)
```

### Take the difference

- $p(34.5 < y < 35.5) = 4.344\%$
- exact = 4.4445%

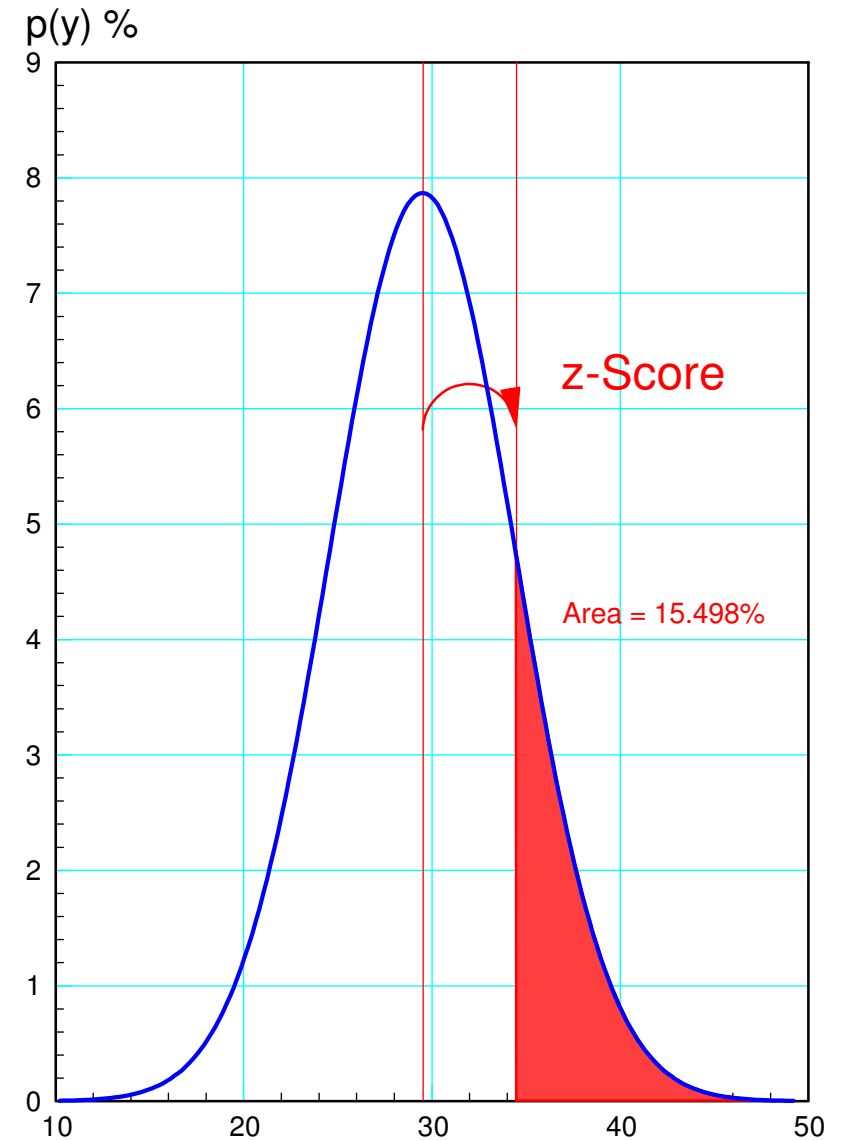

## What is the probability that $y > 35$ ?

- Find the area to the right of 34.5

```
>> z1 = (34.5 - my) / sy  
z1 = 1.0153
```

- $p = 15.498\%$  (from StatTrek)
- $p = 15.8524\%$  (exact)

---

# Standard Normal Table

- $z\text{-score} = 1.0565$
- $p = 14.573\%$

# Comment

If you know the mean and the standard deviation, you can calculate the odds

- Find the z-score
- Distance to the mean in terms of standard deviations

Convert z-scores to probabilities

- Standard-Normal Table
- StatTrek

This requires zero die rolls

- Saving a lot of money
- Saving a lot of time

---

## Problem: What if you *don't* know the mean and standard deviation?

Solution:

- Collect some data
- Estimate the mean and standard deviation from the data

The result is a Student-t Distribution

- Very similar to a Normal distribution
- Takes sample size into account

df \ p	0.001	0.0025	0.005	0.01	0.025	0.05	0.1	0.15	0.2
1	636.61900	318.30900	63.65670	31.82050	12.70620	6.31380	3.07770	1.96260	1.37640
2	31.59910	22.32710	9.92480	6.96460	4.30270	2.92000	1.88560	1.38620	1.06070

100	3.39050	3.17370	2.62590	2.36420	1.98400	1.66020	1.29010	1.04180	0.84520

---

---

## Example: $y = 4d4 + 3d6 + 2d8$

Step 1: Collect Data

Roll the dice three times

```
DATA = [];  
for i=1:3  
    d4 = ceil( 4*rand(1,4) );  
    d6 = ceil( 6*rand(1,3) );  
    d8 = ceil( 8*rand(1,2) );  
    Y = sum(d4) + sum(d6) + sum(d8);  
    DATA = [DATA, Y];  
end
```

```
DATA =      30      40      28
```

---

## Step 2: Compute the

- Mean
- Standard Deviation
- Sample Size

```
>> x = mean(DATA)  
x = 32.6667
```

```
>> s = std(DATA)  
s = 6.4291
```

```
>> n = length(DATA)  
n = 3
```

## Probability $34.5 < y < 35.5$

Calculate the distance to the mean

$$\begin{aligned} >> t1 &= (34.5 - x) / s \\ t1 &= 0.2852 \end{aligned}$$

$$\begin{aligned} >> t2 &= (35.5 - x) / s \\ t2 &= 0.4407 \end{aligned}$$

Convert this to a probability using a Student-t table

- StatTrek also works
- Degrees of Freedom = 2 (Sample Size - 1)
- $p1 = 40.116\%$
- $p2 = 35.124\%$

Difference =  $4.992\%$

- vs.  $4.4445\%$  (exact)

- In the dropdown box, select the statistic of interest.
- Enter a value for degrees of freedom.
- Enter a value for all but one of the remaining textboxes.
- Click the **Calculate** button to compute a value for the blank textbox.

Statistic	<input type="text" value="t score"/>
Degrees of freedom	<input type="text" value="2"/>
Sample mean ( $\bar{x}$ )	<input type="text" value="-0.2852"/>
Probability: $P(X \leq -0.2852)$	<input type="text" value="0.40116"/>
<input type="button" value="Calculate"/>	

---

## Probability $y > 34.5$

Calculate the distance to the mean

```
>> t1 = (34.5 - x) / s  
t1 = 0.2852
```

Convert this to a probability using a Student-t table

- StatTrek also works
- Degrees of Freedom = 2 (Sample Size - 1)
- $p1 = 40.116\%$
- $\text{exact} = 15.8524\%$

# 90% Confidence Interval

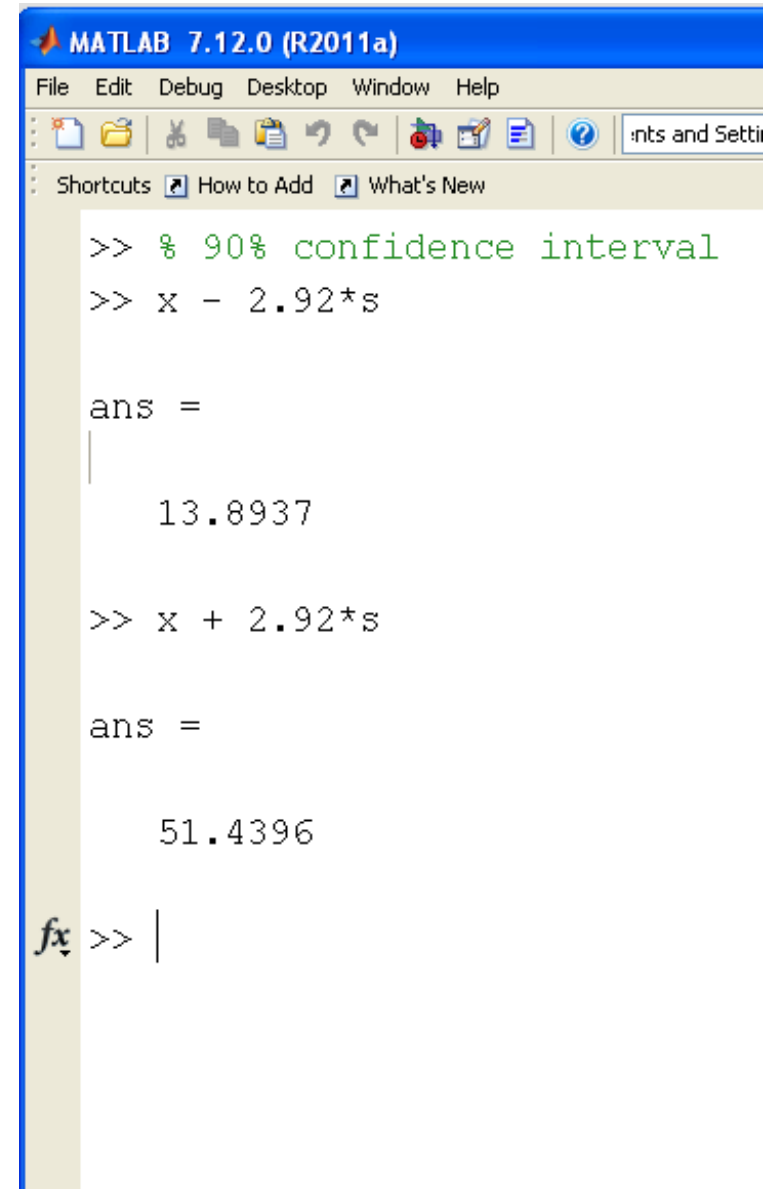

Determine the t-score for

- 2 degrees of freedom
- 5% tails
- $t = 2.9200$

Go left and right of the mean by 2.92 standard deviations

Result

- $13.89 < y < 41.54$  (  $p = 90%$  )
- $21.5 < y < 38.5$  ( from enumeration )

```

## Example: Roll Ten Dice

- $y = 4d4 + 3d6 + 2d8$

### Step 1: Collect Data

```
DATA = [];  
for i=1:10  
    d4 = ceil( 4*rand(1,4) );  
    d6 = ceil( 6*rand(1,3) );  
    d8 = ceil( 8*rand(1,2) );  
    Y = sum(d4) + sum(d6) + sum(d8);  
    DATA = [DATA, Y];  
end
```

**DATA =**

30    21    32    36    29    24    27    35    20    35

---

---

## Step 2: Compute the

- Mean
- Standard Deviation
- Sample Size

```
>> x = mean(DATA)
```

```
x = 28.9000
```

```
>> s = std(DATA)
```

```
s = 5.8205
```

```
>> n = length(DATA)
```

```
n = 10
```

---

## Probability $34.5 < y < 35.5$

Calculate the distance to the mean

$$\begin{aligned} >> t1 &= (34.5 - x) / s \\ t1 &= 0.9621 \end{aligned}$$

$$\begin{aligned} >> t2 &= (35.5 - x) / s \\ t2 &= 1.1339 \end{aligned}$$

Convert this to a probability using a Student-t table

- StatTrek also works
- Degrees of Freedom = 9 (Sample Size - 1)
- $p1 = 18.057\%$
- $p2 = 14.307\%$

Difference =  $3.75\%$

- vs.  $4.4445\%$  (exact)

- In the dropdown box, select the statistic of interest.
- Enter a value for degrees of freedom.
- Enter a value for all but one of the remaining textboxes.
- Click the **Calculate** button to compute a value for the blank textbox.

Statistic	t score
Degrees of freedom	9
t score	-0.9621
Probability: P(T ≤ -0.9621)	0.18057

Calculate

---

## Probability $y > 34.5$

Calculate the distance to the mean

```
>> t1 = (34.5 - x) / s  
t1 = 0.9621
```

Convert this to a probability using a Student-t table

- StatTrek also works
  - Degrees of Freedom = 9 (Sample Size - 1)
  - $p1 = 18.057\%$
  - $\text{exact} = 15.8524\%$
-

# 90% Confidence Interval

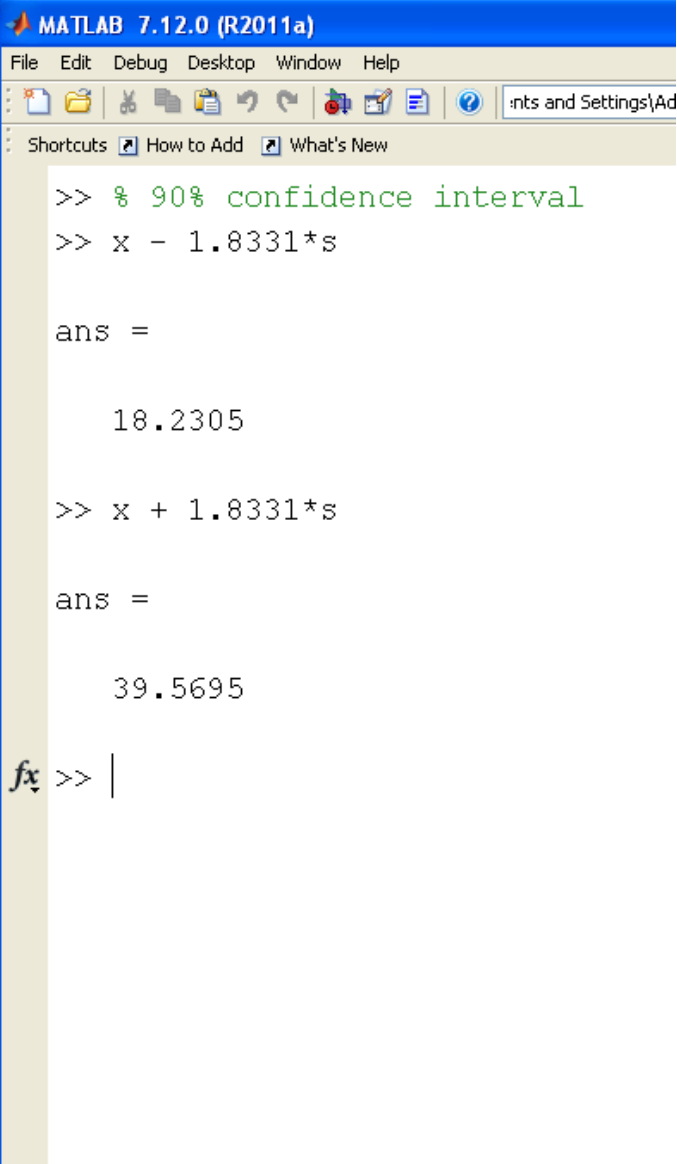

Determine the t-score for

- 9 degrees of freedom
- 5% tails
- $t = 1.8331$

Go left and right of the mean by 1.8331 standard deviations

Result

- $18.23 < y < 39.56$  (  $p = 90%$  )
- $21.5 < y < 38.5$  ( from enumeration )

## Summary

If you want to know what's coming off the assembly line, you need data.

If you measure everything (enumeration),

- You know what you're producing, but
- You have no product (nothing is new)

With a Monte-Carlo simulation,

- You get good results,
- But you need a large sample size (can be expensive)

If you know the mean and standard deviation...

- Use a Normal approximation
- Requires zero measurements

If you don't know the mean and standard deviation...

- Use a Student-t Test
  - Requires a small sample size ( $n \geq 2$ )
  - More data helps, but you don't need a huge amount of data
-
