## ECE 376-Test \#2: Name

## C-Programming on a PIC Processor

Open book, open notes. Calculators and Matlab permitted. Individual effort (help from other people or web sites where other people help you solve the problems not permitted).

1) C Coding \& Flow Charts. Write a $C$ program for an random count-down timer.

- Let N be Your Birth Date (1..31).
- When you press RB0 (PORTB pin 0), a random number (0..255) is placed in PORTC
- The counter then counts down, one count every 1.5 seconds (i.e. problem \#4), until PORTC $<\mathrm{N}$
- It then repeats, waiting for you to press RB0

## Test - Do Not Post

## $\mathrm{N}=14$ (birth date 1..31)

```
#include <pic18.h>
void main(void) {
    ADCON1 = 0x0F;
        TRISB = 0xFF;
        TRISC = 0x00;
        TRISC = 0;
        while(1) {
        while(RBO == 0) {
            PORTC = PORTC + 1;
            }
        while(PORTC >= 14) {
            PORTC = PORTC - 1;
            Wait_ms(1500);
            }
        }
```

2) Battle Bots! Write a C program to control a battle bot.

- A stepper motor is connected to PORTC (left motor) and PORTD (right motor)
- The motor spins forward when PORTX goes through the sequence $\{1,2,4,8$, repeat $\}$
- The motor spins in reverse when PORTX goes through the sequence $\{8,4,2,1$, repeat $\}$

PORTB controls the motor ( $10 \mathrm{~ms} /$ step when the motor is spinning)

| Button | none | RB3 <br> forward | RB2 <br> turn left | RB1 <br> turn right | RB0 <br> reverse |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Left Motor | stop | forward | reverse | forward | reverse |
| (PORTC ) |  | $1-2-4-8$ | $8-4-2-1$ | $1-2-4-8$ | $8-4-2-17$ |
| Right Motor | stop | forward | forward | reverse | reverse |
| ( PORTD ) |  | $1-2-4-8$ | $1-2-4-8$ | $8-4-2-1$ | $8-4-2-1$ |

Write the corresponding C code

LEFT $=0$;
RIGHT $=0$;
while(1) \{
if (RB3) \{ LEFT = LEFT + 1; RIGHT = RIGHT + 1; \}
if (RB2) $\{$ LEFT = LEFT - 1; RIGHT = RIGHT + 1; \}
if (RB1) \{ LEFT = LEFT + 1; RIGHT = RIGHT - 1; \}
if (RBO) \{ LEFT = LEFT - 1; RIGHT = RIGHT - 1; \}
PORTC = TABLE[ LEFT \% 4 ];
PORTD = TABLE[ RIGHT \% 4 ];
Wait_ms(10);
\}
\}

## Analog Inputs

3) Assume the $A / D$ input to a PIC processor has the following hardware connection where $R_{T}$ is a 3 k thermistor where T is the temperature in degrees C

$$
R_{T}=3000 \cdot \exp \left(\frac{3200}{T+273}-\frac{3200}{298}\right) \Omega
$$

Let R be a resistor

$$
\mathrm{R}=1000+100^{*}(\text { your birth month })+(\text { your birth date }) .
$$

For example, May 14th would result in $\mathrm{R}=1514$ Ohms
If the $\mathrm{A} / \mathrm{D}$ reading is 372 , determine
Test - Do Not Post

- The voltage at V1
- The temperature in degrees C , and
- How much the temperature would have to change for the PIC to detect that change

| R <br> $1000+100^{*} \mathrm{mo}+$ day | A/D Reading | V 1 <br> volts | RT <br> (Ohms ) | Temperature <br> degrees C |
| :---: | :---: | :---: | :---: | :---: |
| $\mathbf{1 5 1 4}$ Ohms | $\mathbf{3 7 2}$ | $\mathbf{1 . 8 1 8 V}$ | $\mathbf{8 6 5}$ Ohms | $\mathbf{6 4 . 0 3 C}$ |

$$
\begin{aligned}
& V_{1}=\left(\frac{372}{1023}\right) 5.00 \mathrm{~V}=1.818 \mathrm{~V} \\
& V_{1}=\left(\frac{R_{T}}{R_{T}+1514}\right) 5 \mathrm{~V} \\
& R_{T}=\left(\frac{1.818 \mathrm{~V}}{5_{V-1.818 V}}\right) 1514 \Omega=865.1 \Omega \\
& T=64.03^{\circ} \mathrm{C}
\end{aligned}
$$

## chi-squared test

4) (10pt). A 5-sided die is rolled 33 times. The results are

| 1 | 2 | 3 | 4 | 5 |
| :---: | :---: | :---: | :---: | :---: |
| 8 | 9 | 7 | 6 | 13 |

Use a chi-squared test to determine the probability that this is a fair die (all numbers have equal probability)

|  |  |  |  |  | Do No |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  | quared <br> jecting th | able <br> 11 hypoth |  |  |  |  |
| dof | 99.5\% | 99\% | 97.5\% | 95\% | 90\% | 10\% | 5\% | 2.5\% | 1\% | 0.5\% |
| 1 | 7.88 | 6.64 | 5.02 | 3.84 | 2.71 | 0.02 | 0 | 0 | 0 | 0 |
| 2 | 10.6 | 9.21 | 7.38 | 5.99 | 4.61 | 0.21 | 0.1 | 0.05 | 0.02 | 0.01 |
| 3 | 12.84 | 11.35 | 9.35 | 7.82 | 6.25 | 0.58 | 0.35 | 0.22 | 0.12 | 0.07 |
| 4 | 14.86 | 13.28 | 11.14 | 9.49 | 7.78 | 1.06 | 0.71 | 0.48 | 0.3 | 0.21 |
| 5 | 16.75 | 15.09 | 12.83 | 11.07 | 9.24 | 1.61 | 1.15 | 0.83 | 0.55 | 0.41 |

| roll | p | np | N | chi squared |
| :---: | :---: | :---: | :---: | :---: |
| 1 | $1 / 5$ | 6.6 | 8 | 0.3 |
| 2 | $1 / 5$ | 6.6 | 9 | 0.87 |
| 3 | $1 / 5$ | 6.6 | 7 | 0.02 |
| 4 | $1 / 5$ | 6.6 | 6 | 0.05 |
| 5 | $1 / 5$ | 6.6 | 13 | 6.21 |
|  |  |  |  | Total |
|  |  |  |  |  |

From the Chi-squared table with 4 degrees of freedom, a chi-squared score of 7.45 corresponds to a probability of $90 \%$

I am $\mathbf{9 0 \%}$ certain this is not a fair die

## t-Tests

5) (15pt) Through week \#5, the opponents of the Minnesota Vikings have scored:

- $\{27,34,17,14,17\}$ points
- mean $=21.800$ points per game
- standard deviation $=8.408$ points per game
a) Use a t-test to determine how many points the Vikings have to score on offense to be $99 \%$ certain of winning the game?
b) Assume the Vikings score 34 points in game \#6. What is the chance they will win that game?

| Test - Do Not Post <br> Student t-Table <br> area of tail |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| dof $\backslash \mathrm{p}$ | 0.25 | 0.20 | 0.15 | 0.10 | 0.05 | 0.025 | 0.01 | 0.005 | 0.001 | 0 |
| 1 | 1 | 1.38 | 1.96 | 3.08 | 6.31 | 12.71 | 31.82 | 63.66 | 318.31 | 636.62 |
| 2 | 0.82 | 1.06 | 1.39 | 1.89 | 2.92 | 4.3 | 6.97 | 9.93 | 22.33 | 31.6 |
| 3 | 0.77 | 0.98 | 1.25 | 1.64 | 2.35 | 3.18 | 4.54 | 5.84 | 10.22 | 12.92 |
| 4 | 0.74 | 0.94 | 1.19 | 1.53 | 2.13 | 2.78 | 3.75 | 4.6 | 7.17 | 8.61 |
| 5 | 0.73 | 0.92 | 1.16 | 1.48 | 2.02 | 2.57 | 3.37 | 4.03 | 5.89 | 6.87 |
| infinity | 0.674 | 0.842 | 1.036 | 1.282 | 1.645 | 1.960 | 2.326 | 2.576 | 3.090 | 3.29 |

a) 5 data points means 4 degrees of freedom
$99 \%$ certain means a tail with $1 \%$ area
We're looking for a t-score of 3.75

$$
\begin{aligned}
& \text { points }=x+3.75 s \\
& \text { points }=21.80+3.75 \cdot 8.408 \\
& \text { points }=53.33 \text { points }
\end{aligned}
$$

This Vikings need to score 53.33 points to be $\mathbf{9 9 \%}$ certain of winning.
b) If the Vikings score 34 points,

The $t$-score is

$$
t=\left(\frac{34-21.8}{8.408}\right)=1.451
$$

This corresponds to a tail with an area of about $13 \%$
If the Vikings score 34 points, there is a $13 \%$ chance they will lose If the Vikings score 34 points, there is an $87 \%$ chance they will win
