## ECE 376 - Test \#3: Name

Fall 2023
1a) Single Interrupt. The following $C$ code sets up a Timer2 interrupt to output a square wave on RC0.
Determine the frequency that appears on pin RC 0 .
T2CON $=0 \times 73=\mathrm{b} 01110011$

$$
\mathrm{A}=15, \mathrm{C}=16
$$

PR2 $=46$
$B=47$
In the interrupt, RC0 toggles every 13th interrupt, so
$\mathrm{N}=13 * \mathrm{~A} * \mathrm{~B} * \mathrm{C}$
$\mathrm{N}=146,640$
$f=\left(\frac{10,000,000}{2 \cdot N}\right)=34.097 \mathrm{~Hz}$
b..f) If the following sections of code are deleted, what frequency will you see on pin RC0?

| Section of Code | Frequency on RC0 if this section is deleted |
| :---: | :---: |
| ```// Global variable unsigned int COUNT void interrupt IntServe(void) {``` | code doesn't compile |
| $\begin{aligned} & \mathrm{N}=(\mathrm{N}+1) \% 13 ; \\ & \text { if }(\mathrm{N}==0) \end{aligned}$ | b) RC toggles every interrupt, resulting in 13x the frequency $f=443.26 \mathrm{~Hz}$ |
| $\mathrm{RCO}=$ ! RC0; | c) RCO never toggles. $f=0 \mathrm{~Hz}$ |
| TMR2IF = 0; | d) Stuck inside the interrupt interrupt every 50 clocks $\begin{aligned} N & =13 * 50 \\ \mathbf{f} & =7692 \mathrm{~Hz} \end{aligned}$ |
| ```} void main(void) { TRISC = 0; ADCON1 = 0x0F;``` | code doesn't compile |
| $\begin{array}{ll} \mathrm{T} 2 \mathrm{CON} & =0 \times 73 ; \\ \text { PR2 } & =46 ; \end{array}$ | e) A,B,C are something, I just don't know what (they are not initialized incode) <br> frequency $=$ unknown |
| $\begin{aligned} & \operatorname{TMR2ON}=1 ; \\ & \operatorname{TMR2IE~=1;} \\ & \operatorname{TMR2IP~=1;~} \\ & \operatorname{PEIE}=1 ; \\ & \text { GIE }=1 ; \end{aligned}$ | f) Interrupts are not called $\mathbf{f}=\mathbf{0 H z}$ |
| ```while(1) { RC1 = !RC1; } }``` | code doesn't compile |

2) Multiple Interrupts: Give the interrupt service routine and interrupt initialization code for a Hungry Hungry Hippo game where each player has a hadicap:

- Player A gets one point for every rising edge on RA4 (Timer0 external input)
- Player B gets one point for every 3rd rising edge on RC0 (Timer1 external input)
- Player C gets one point for every 5th rising edge on RC1 (Timer3 external input)

Interrupt Initialization

|  | Timer0 <br> count every rising edge on RA4 | Timer1 <br> count every 3rd rising edge on RC0 | Timer3 <br> count every 5th rising edge on RC1 |
| :---: | :---: | :---: | :---: |
| Initialization | TOCS $=1 ;$ <br> TOCON $=0 \times 88 ;$ | TMR1CS $=1$ | TMR3CS $=1$ |
|  |  | T1CON $=0 \times 81$ |  |
| PS |  |  |  |

## Interrupt Service Routines (Option 1)

| Timer0 <br> count every rising edge on RA4 | Timer 1 <br> count every 3rd rising edge on RC0 | Timer3 <br> count every 5 th rising edge on RC 1 |
| :---: | :---: | :---: |
| if(TMR0IF) \{ | if (TMR1IF) \{ | if (TMR3IF) \{ |
| TMR0 $=-1$; | TMR1 = -3; | TMR3 $=-5$; |
| $\mathrm{A}=\mathrm{A}+1$; | $\mathrm{B}=\mathrm{B}+1$; | $\mathrm{C}=\mathrm{C}+1$; |
| TMROIF $=0$; | $\begin{aligned} & \text { TMR1IF }=0 ; ~ \\ & \} \end{aligned}$ | TMR3IF $=0$; |
| \} |  | \} |

## (Option 2)

| Timer0 <br> count every rising edge on RA4 | Timer 1 <br> count every 3 rd rising edge on RC 0 | Timer3 <br> count every 5th rising edge on RC1 |
| :---: | :---: | :---: |
| if(TMR0IF) \{ | if (TMR1IF) \{ | if (TMR3IF) \{ |
| TMR0 $=-1$; | TMR1 = -1; | TMR3 $=-1$; |
| $\mathrm{A}=\mathrm{A}+1 ;$ | $\mathrm{Nb}=(\mathrm{Nb}+1) \% 3 ;$ | $\mathrm{NC}=(\mathrm{NC}+1) \% 5 ;$ |
| TMROIF $=0$; | $\begin{aligned} & \text { if }(\mathrm{Nb}==0) \\ & \mathrm{B}=\mathrm{B}+1 ; \end{aligned}$ | $\begin{aligned} & \text { if }(\mathrm{Nc}==0) \\ & \mathrm{C}=\mathrm{C}+1 ; \end{aligned}$ |
|  | $\begin{aligned} & \operatorname{TMR1IF}=0 ; \\ & \} \end{aligned}$ | $\begin{aligned} & \text { TMR3IF }=0 ; \\ & \} \end{aligned}$ |

3) Bathroom Fan: Write a $C$ program which uses interrupts to control the light and fan in a bathroom:

- RB0 On: Turn on the light and the fan when RB0 is pressed
- RB1 Off: Turn off the light when RB1 is pressed and the fan remains on.
- 10.00 seconds later, the fan is then turned off

Assume

- RC 0 controls the bathroom light $(1=\mathrm{on}, 0=$ off $)$
- RC 1 controls the fan $(1=\mathrm{on}, 0=$ off $)$
a) Interrupt Initialization: (affects the interrupt service routine)

| INT0 <br> rising or falling edge | INT1 <br> rising or falling edge | Timer0 |
| :---: | :---: | :---: |
| rising edge | rising edge | Prescalar for Timer0 $(1,2,4,8,16,32,64,128,256)$ |

b) Interrupt service Routines

| INT0 <br> trigger on RB0 | INT1 <br> trigger on RB1 | Timer0 <br> Called every 1.00 second |
| :---: | :---: | :---: |
| $\begin{aligned} & \text { if (INTOIF) }\{ \\ & \text { RC0 }=1 ; \\ & \text { RC1 }=1 ; \\ & \quad \begin{array}{l} \text { INT0IF }=0 ; \\ \} \end{array} \end{aligned}$ | ```if(INT1IF) { RCO = 0; N = 10; TMR0 = -39062; INT1IF = 0; }``` | ```if(TMR0IF) { TMR0 = -39062; if(N) N = N - 1; if(RCO) RC1 = 1; else if(N == 0) RC1 = 0; TMROIF = 0; }``` |

4) Digital Filters: Assume $X$ and $Y$ are related by

$$
Y=\left(\frac{2(s+3)(s+5)}{(s+1)(s+10)}\right) X
$$

a) Give the transfer funciton for a digital filter, $G(z)$, which has

- Approximately the same gain vs. frequency,
- With a sampling rate of $T=0.01$ seconds

Convert from the s-plane to the z-plane as $z=\exp (s T)$

$$
\begin{array}{ll}
s=-3 & z=e^{s T}=0.9704 \\
s=-5 & z=e^{s T}=0.9512 \\
s=-1 & z=e^{s T}=0.9900 \\
s=-10 & z=e^{s T}=0.9048
\end{array}
$$

so $G(z)$ is of the form

$$
G(z)=k\left(\frac{(z-0.9704)(z-0.9512)}{(z-0.9900)(z-0.9048)}\right)
$$

Pick k to match the DC gain

$$
\begin{aligned}
& \left(\frac{2(s+3)(s+5)}{(s+1)(s+10)}\right)_{s=0}=3.00 \\
& k\left(\frac{(z-0.9704)(z-0.9512)}{(z-0.9900)(z-0.9048)}\right)_{z=1}=3.00
\end{aligned}
$$

$$
k=1.9708
$$

$$
G(z)=1.9708\left(\frac{(z-0.9704)(z-0.9512)}{(z-0.9900)(z-0.9048)}\right)
$$

b) Write a C program to implement this filter assuming a sampling rate of $\mathrm{T}=0.01$ seconds.

Multiply out

$$
Y=1.9708\left(\frac{z^{2}-1.9217 z+0.9231}{z^{2}-1.8949 z+0.8958}\right) X
$$

Cross multiply

$$
\left(z^{2}-1.8949 z+0.8958\right) Y=1.9708\left(z^{2}-1.9217 z+0.9231\right) X
$$

Convert to a difference equation

$$
\mathrm{y}(\mathrm{k}+2)-1.8949 \mathrm{y}(\mathrm{k}+1)+0.8958 \mathrm{y}(\mathrm{k})=1.9708(\mathrm{x}(\mathrm{k}+2)-1.9217 \mathrm{x}(\mathrm{k}+1)+0.9231 \mathrm{x}(\mathrm{k}))
$$

Time shift by 2 (change of variable)

$$
\mathrm{y}(\mathrm{k})-1.8949 \mathrm{y}(\mathrm{k}-1)+0.8958 \mathrm{y}(\mathrm{k}-2)=1.9708(\mathrm{x}(\mathrm{k})-1.9217 \mathrm{x}(\mathrm{k}-1)+0.9231 \mathrm{x}(\mathrm{k}-2))
$$

Sovle for $\mathrm{y}(\mathrm{k})$

$$
\mathrm{y}(\mathrm{k})=1.8949 \mathrm{y}(\mathrm{k}-1)-0.8958 \mathrm{y}(\mathrm{k}-2)+1.9708(\mathrm{x}(\mathrm{k})-1.9217 \mathrm{x}(\mathrm{k}-1)+0.9231 \mathrm{x}(\mathrm{k}-2))
$$

That's essentially your program

```
while(1) {
    x2 = x1;
    x1 = x0;
    x0 = A2D_Read(0);
    y2 = y1;
    y1 = y0
    y0 = 1.8949*y1 - 0.8958*y2 + 1.9708*( x0 - 1.9217*x1 + 0.9231*x2 );
    D2A(y0);
        Wait_10ms();
        }
```
