## ECE 376 - Final Exam: Name

Open-Book, Open Note, Calculators and Matlab permitted. Individual Effort.

1) Binary Inputs: Assume a 6411 NPN transistor (if needed)

- $\quad \mathrm{Vbe}=0.7 \mathrm{~V}$
- $\quad \mathrm{Vce}(\mathrm{sat})=0.2 \mathrm{~V}$
- $\beta=300$
- $\max (\mathrm{Ic})=6 \mathrm{~A}$

1a) Give a circuit which allows a PIC to turn on and off a 20 mW LED at 10 mA

- $\mathrm{Id}=10 \mathrm{~mA}$
- $\mathrm{Vd}=2.0 \mathrm{~V}$

1b) Give a circuit which allows a PIC to turn on and off a 30W LED

- $\mathrm{Vd}=15.0 \mathrm{~V}$
- $\mathrm{Id}=2.0 \mathrm{~A}$

2) Analog Inputs: A CdS light sensor has the following resistance - lux (light intensity) relationship

$$
R_{2}=1000 \cdot\left(\frac{10}{L u x}\right)^{0.6} \mathrm{Ohms}
$$

If the room is 100 Lux, determine

- The resistance,
- The voltage,
- The A/D reading, and
- The resolution (the smallest change in Lux you can detect)
with the following circuit. Assume

- $\mathrm{R}=900+100 *$ (your birth month) + (your birth date)

| R <br> $900+100^{*}$ mo + day | A/D reading <br> $0 . .1023$ | Voltage <br> votlage at 100 Lux | R <br> resistance at 100 Lux | Resolution <br> smallest change in Lux you <br> can measure |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |

3) C-Coding: Write a C progra to turn your PIC into a $\$ 65$ SR flip flop. Assume the following pin assignments

| PORTB |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| RB7 | RB6 | RB5 | RB4 | RB3 | RB2 | RB1 | RB0 |
| - | - | - | Q <br> output | !Q <br> output | S <br> input | R <br> input | CLK |
| input |  |  |  |  |  |  |  |

4) C Coding with Analog Inputs: Assume a temperature sensor is connected to a PIC so that the A/D reading is $10 x$ the temperature in degrees $F$.

Write a C program which turns on and off a fan connected to RC0 based upon the temperature

| Temperature | A/D reading | $\%$ On | On-Time (RC0) | Off-Time (RC0) |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{T}>85 \mathrm{~F}$ | $850-1023$ | $100 \%$ | always on |  |
| $80 \mathrm{~F}<\mathrm{T}<85 \mathrm{~F}$ | $800-849$ | $75 \%$ | 45 seconds | 15 seconds |
| $75<\mathrm{T}<80$ | $750-799$ | $50 \%$ | 30 seconds | 30 seconds |
| $70<\mathrm{T}<75$ | $700-749$ | $25 \%$ | 15 seconds | 45 seconds |
| $\mathrm{T}<70$ | $0-699$ | $0 \%$ | - | always off |

```
void main(void)
{
// Initialize the A/D port
    TRISA = 0xFF;
    TRISE = 0x0F;
    ADCON2 = 0x85;
    ADCON1 = 0x07;
    ADCONO = 0x01;
    while(1) {
```

5) 20ms Delay (take 1): Using one or more Timer and/or INT interrupts, write the interrupt service routine for a C program which

- Reads in X , a TTL signal $(0 \mathrm{~V} / 5 \mathrm{~V})$, and
- Outputs Y, the same waveform with a 20 ms delay.

Assume each edge is more than 20 ms apart

| Input Pin <br> (your pick) | Output Pin <br> (your pick) | Pre-scalar assumed <br> if needed |
| :---: | :---: | :---: |
|  |  |  |

// Global Variables (if needed)
// Interrupts service routine
void interrupt IntServe(void) \{
6) 20ms Delay (take 2 - Capture / Compare Interrupts): Write a program which uses Capture \& Compare interrupts to

- Output a waveform (Y) which is identical to X, only
- Y is delayed by 20 ms

Assume each edge is more than 20 ms apart

| Timer1 Interrupt <br> assume pre--scalar $=8$ | Capture1 (Input) | Compare2 (Output) |
| :--- | ---: | ---: |
| if (TMR1IF) $\{$ | if (CCP1IF) $\}$ | if (CCP2IF) \{ |
