## ECE 376 - Homework \#8

Timer 2 Interrupts. Due Monday, March 28th

## Measuring Time to 0.1 ms with Timer2 Interrupts

1) Write a routine for a count-down timer with a resolution of 0.1 ms (repeat homework \#4 but now with interrupts)

- Time is measured to 0.1 ms using Timer2 interrupts
- Each interrupt, pin RC0 is toggled (outputting a 5 kHz square wave on RC 0 )
- Each interrupt (every 0.1 ms ), TIME is decremented to zero, stopping at zero
- TIME is displayed on the LCD display to 1 ms : $\mathrm{xx} . \mathrm{xxxx}$
- When you press RB0, the time is reset to 5.0000 seconds
- When you press RB1, the time is reset to 10.0000 seconds
- When you press RB2, the time is reset to 15.0000 seconds
- When you press RB3, the time is reset to 20.0000 seconds

Check the accuracy of your stopwatch

- Measure the frequency on RC0 when sent to a speaker using a cell phone app (Frequency Counter works)

Code:
< insert code and flow chart >

## Compilation Results:

```
Memory Summary:
    Program space
    Data space
    EEPROM space
    ID Location space
Configuration bits
lused
AOOh (2602) of 10000h bytes
    33h (51) of F80h bytes (1.3%)
    Oh ( 0) of 400h bytes (0.0%)
    Oh ( 0) of 8h nibbles
0.0%)

```

Frequency on RA1: 5003.0 Hz

- verifies that timer2 is running every 100us
- ( 99.940us measured )

III

## Generating Frequencies with Timer2 Interrupts

2) Write a routine which turns plays your PIC into a 1-string banjo using Timer2 interrupts

- Play note D3\# $(155.56 \mathrm{~Hz})$ on pin RC0 when button RB0 is pressed
- Check the accuracy of your music note using your cell phone (or whatever else you have on hand)

$$
N=A B C=\left(\frac{10,000,000}{2 \cdot H z}\right)=32,141.939
$$

Let

- $\mathrm{A}=8$
- $\mathrm{B}=251$
- $\mathrm{C}=16$

$$
N=A B C=32,128(0.043 \% \text { low })
$$

To do this

| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 |  |  |  |  |
|  | $\mathrm{~A}=8$ |  |  |  |  |  |  |  | T2E | $\mathrm{C}=16$ |  |

- $\mathrm{T} 2 \mathrm{CON}=0 \times 3 \mathrm{~F}$
- $\mathrm{PR} 2=250$

Result:

- $\mathrm{f}=155.6 \mathrm{~Hz}$

Code:

```
// Problem #2
// 123.47Hz
// Global Variables
const unsigned char MSGO[21] = "155.56Hz
const unsigned char MSG1[21] = "
// Subroutine Declarations
#include <pic18.h>
// Subroutines
#include "lcd_portd.c"
// High-priority service
void interrupt IntServe(void)
{
    if (TMR2IF) {
        if(RB0) RC1 = !RC1;
        TMR2IF = 0;
        }
```

```
    }
// Main Routine
void main(void)
{
    unsigned char i;
    TRISA = 0;
    TRISB = 0xFF;
    TRISC = 0;
    TRISD = 0;
    TRISE = 0;
    ADCON1 = 0x0F;
    LCD_Init(); // initialize the LCD
    LCD_Move(0,0); for (i=0; i<20; i++) LCD_Write(MSG0[i]);
    LCD_Move(1,0); for (i=0; i<20; i++) LCD_Write(MSG1[i]);
// set up Timer2 155.56Hz
    T2CON = 0x3F;
    PR2 = 250;
    TMR2ON = 1;
    TMR2IE = 1;
    TMR2IP = 1;
    PEIE = 1;
// turn on all interrupts
    GIE = 1;
    i = 0;
    while(1) {
        i = i + 1;
        LCD_Move(1,0); LCD_Out(i, 3, 0);
        Wait_ms(250);
        }
    }
```

## Steppper Motor Roulette Wheel

3) Requirements: Explain what the inputs are / what the outputs are / and how they relate. Also explain how Timer2 interrupts will be used in your embedded system.

Input:

- RB0

## Output:

- Stepper Motor (on PORTA)
- LCD Display (on PORTD)

Relationship:

- To start the game, press and release RB0.
- This generates a random number from $0 . .7$
- The stepper motor then turns 3 rotations plus $25^{*} \mathrm{~N}$ steps at a rate of $10 \mathrm{~ms} / \mathrm{step}$ (set by Timer2)
- The number (0..7) is also displayed on the LCD display as the stepper motor turns

## Calculations:

$10 \mathrm{~ms} /$ step is too large for Timer2 directly. So, a counter is added so that the stepper motor turns every 10th interrupt

- Timer2: 1ms
- $\mathrm{A}=10$
- $B=250$
- $\mathrm{C}=4$
- Toggle RD0 every interrupt (results in 500 Hz square wave on RD0)
- 10 th interrupt $=10 \mathrm{~ms}$
- Step the motor every 10 ms

4) C-Code and flow chart.
< insert code >

## 5) Data. Your raw data (at least two data points)

Timer2 Interrupt

- 499.0 Hz

Winning Numbers

- $1,6,3,0,1,5,0,3,7,5,6,0,5$

6) Statistical Analysis: Analyze your data to determine

- The $90 \%$ confidence interval, or
- Who in your group can jump the highest (with what probability level), or
- Something else (your pick - just use some statistics to anlayze your data)

With only 14 numbers, there isn't enough data to do a chi-squared test with 8 bins, so use two bins

| bin | p | np | N | chi-squared |
| :---: | :---: | :---: | :---: | :---: |
| even | 0.5 | 7 | 8 | $1 / 7$ |
| odd | 0.5 | 7 | 6 | $1 / 7$ |
| $\quad$$\|c\|$ |  | Total | $2 / 7$ |  |

From StatTrek, with 1 degree of freedom, this corresponds to a probability of 0.41
I am $41 \%$ certain this is not a fair die
Using a different grouping:

| bin | p | np | N | chi-squared |
| :---: | :---: | :---: | :---: | :---: |
| $0 . .3$ | 0.5 | 7 | 7 | $0 / 7$ |
| $4 . .7$ | 0.5 | 7 | 7 | $0 / 7$ |
|  |  |  |  |  |

I am $0 \%$ certain this is not a fair die

Using yet another grouping:

| bin | p | np | N | chi-squared |
| :---: | :---: | :---: | :---: | :---: |
| 0 or 5 | $2 / 8$ | 3.5 | 6 | 1.786 |
| other | $6 / 8$ | 10.5 | 11 | 0.595 |
|  | Total |  |  | 2.381 |

From a chi-squared table with 1 degree of freedom, this corresponds to a probability of 0.88
I am $\mathbf{8 8 \%}$ certain this is not a fair die
7) Demo (in person during Zoom office hours or in a video)
