## ECE 376-Test \#2: Name

## C-Programming on a PIC Processor

Open book, open notes. Calculators and Matlab permitted. Individual effort (help from other people or web sites where other people help you solve the problems not permitted).

1) C Coding \& Flow Charts. Write a C program for video game cheat:

- Each time you press RB0 (rising edge)
- N pulses are output on RC 0 (fire N times)
- Each pulse is on for 100 ms , off for 100 ms

Let N be your birth month plus one (2..14)
$N=$ $\qquad$ (month + 1)

```
#include <pic18.h>
void main(void) {
    ADCON1 = 0x0F;
```

2) Binary Clock! Write a $C$ subroutine to drive the display on a binary clock.

- Hours, Minutes, and Seconds are passed to the subroutine
- Hours are displayed on PORTA as (tens : ones )
- Minutes are displayed on PORTB as (tens : ones )
- Seconds are displayed on PORTC as (tens : ones )

For example: 12:36:57 would display as

## Analog Inputs

3) Assume the $A / D$ input to a PIC processor has the following hardware connection where $\mathrm{R}_{\mathrm{T}}$ is a 3 k thermistor where T is the temperature in degrees C

$$
R_{T}=2000 \cdot \exp \left(\frac{4200}{T+273}-\frac{4200}{298}\right) \Omega
$$

Let R be a resistor

$$
\mathrm{R}=900+100^{*}(\text { your birth month })+(\text { your birth date }) .
$$

If the $\mathrm{A} / \mathrm{D}$ reading is 769 , determine

- The voltage at V1

- The resistance, $\mathrm{R}_{\mathrm{T}}$,
- The temperature, T, in degrees C , and
- The smallest change in termperature you can detect

| R <br> $900+100 * \mathrm{mo}+$ day | A/D Reading | V1 <br> volts | $\mathrm{R}_{\mathrm{T}}$ <br> Ohm | Temperature <br> degrees C | Smallest change in T <br> you can detect |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\mathbf{7 6 9}$ |  |  |  |  |

## chi-squared test

4) (10pt). The number of scores that fall into each region for NFL teams in 2021 (week 1-4) are:

| $0-9$ | $10-19$ | $20-29$ | $30-39$ | $40-49$ |
| :---: | :---: | :---: | :---: | :---: |
| 11 | 33 | 48 | 30 | 6 |

Use a chi-squared test to determine the probability that points scored follows a Normal distribution with

- Mean $=23.5$
- Standard Deviation $=9.66$

| Points Scored | probability p <br> normal distribution | np <br> $\mathrm{n}=128$ scores | N <br> \# scores in this region | chi-squared score |
| :---: | :---: | :---: | :---: | :---: |
| $0-9$ | 0.074 | 9.47 | 11 |  |
| $10-19$ | 0.3326 | 45.57 | 33 |  |
| $20-29$ | 0.393 | 50.30 | 48 |  |
| $30-39$ | 0.218 | 27.90 | 30 |  |
| $40+$ | 0.049 | 6.72 | 6 |  |

## t-Tests

5) (15pt) The current gain of four ZTX869 transistors were measured using the correct and incorrect polarity

| polarity | Current gain | mean | st dev |
| :---: | :---: | :---: | :---: |
| correct | $\{605,743,564,588\}$ | 625.0 | 80.44 |
| incorrect | $\{507,655.452 .488\}$ | 525.5 | 89.29 |

a) What is the $90 \%$ confidence interval for the gain of a ZTX869 transistor when used with the correct polarity?
b) What is the probability that the correct polarity has a higher gain than the incorrect polarity?
