

ECE 376 - Homework #3

Binary Inputs, Binary Outputs, & LEDs - Due Monday, January 29th

Binary Inputs

Assume a thermistor has a resistance-temperature relationship of

$$R = 1000 \cdot \exp\left(\frac{3905}{T+273} - \frac{3905}{298}\right) \Omega$$

1) Design a circuit which outputs

- 0V when $T < 10^\circ\text{C}$
- 5V when $T > 10^\circ\text{C}$

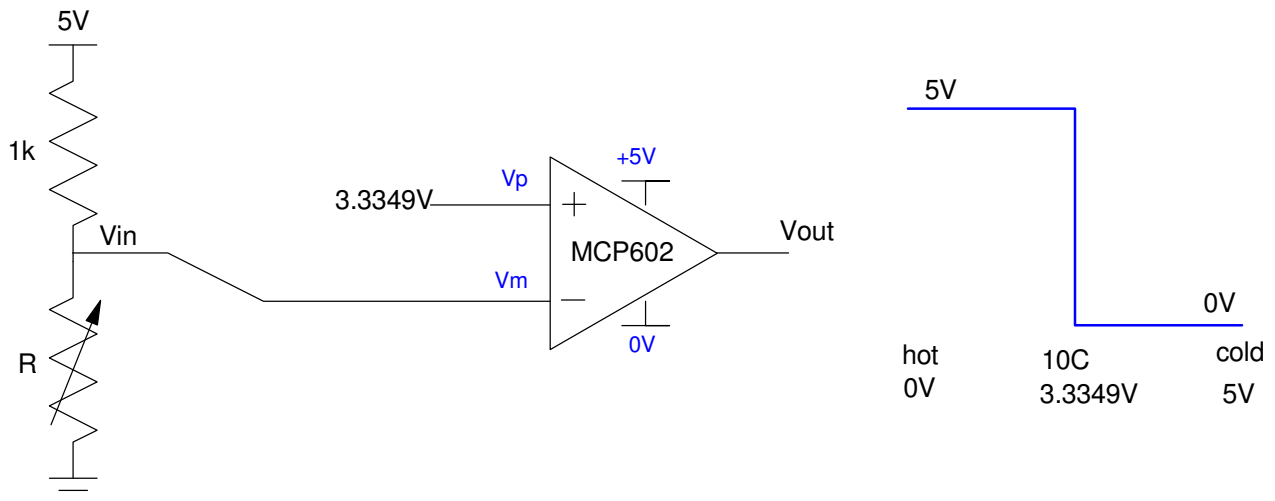

Assume a voltage divider with a 1k resistor. At 10°C ,

- $R = 2002.817 \text{ Ohms}$
- $V_{\text{in}} = 3.3349\text{V}$

As temperature goes up

- R goes down
- V_{in} goes down
- V_{out} goes up

Connect to the minus input (negative correlation)

2) Design a circuit which outputs

- 0V when $T < 10^{\circ}\text{C}$
- 5V when $T > 15^{\circ}\text{C}$

This is a Schmitt trigger. Assume a voltage divider with a 1k resistor:

At 10°C ,

- $R = 2002.817\ \Omega$
- $V_{in} = 3.3349\text{V}$
- V_{out} goes low

At 15°C ,

- $R = 1576.1749\ \Omega$
- $V_{in} = 3.0591\text{V}$
- V_{out} goes high

$V_{on} < V_{off}$

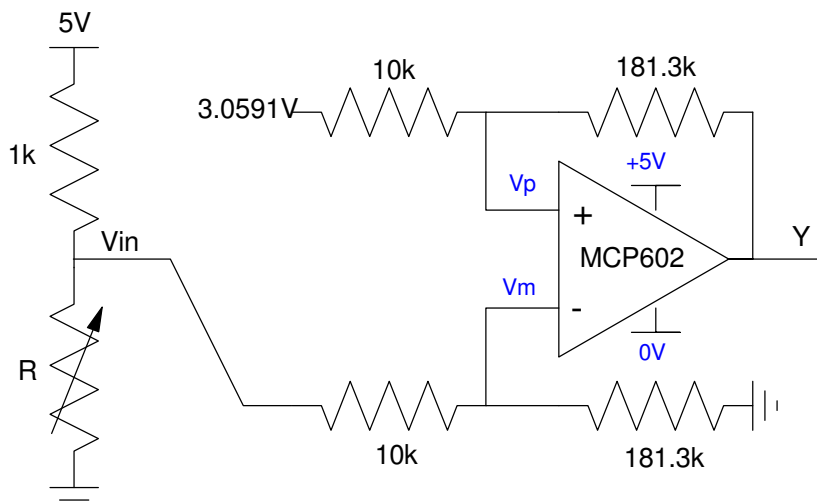

- Connect to the minus input

$V_{on} = 3.0591\text{V}$

- set the offset to 3.0591V

Slope = gain

- $gain = \left(\frac{5\text{V} - 0\text{V}}{3.3349\text{V} - 3.0591\text{V}} \right) = 18.13$
- set the resistor ratio to 18.13

3) Design a circuit which outputs

- 5V when $10C < T < 15C$
- 0V otherwise

Option #1: Use two comparators (problem #1)

- RB0: $T > 10C$
- RB1: $T > 15C$

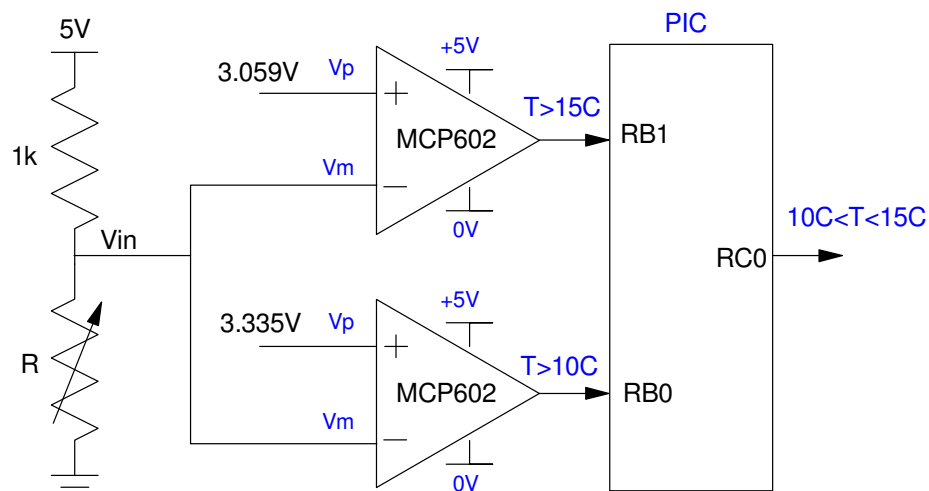

In software, implement the logic

$$RC0 = RB0 \cdot \overline{RB1}$$

```
Main:
    btfsc    PORTB,1
    goto     Clear
    btfss    PORTB,0
    goto     Clear

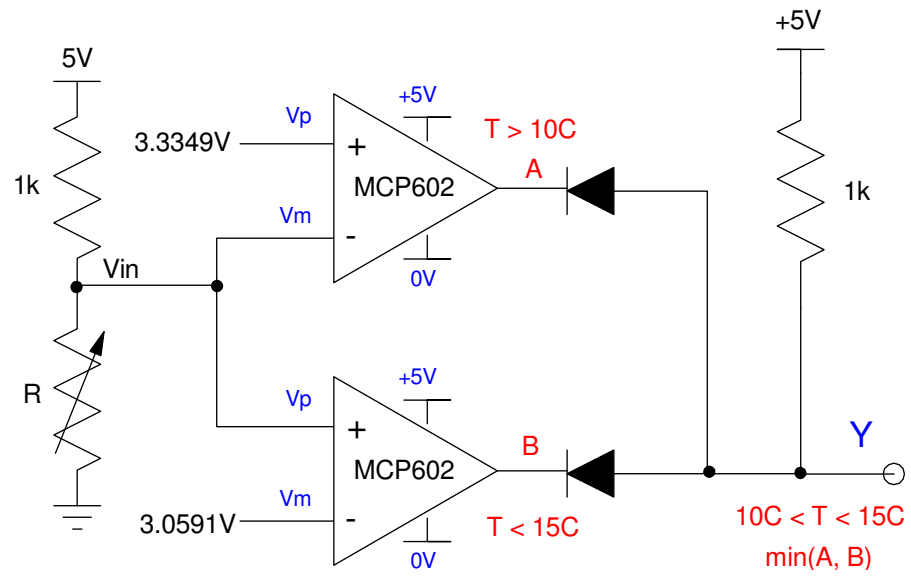

Set:
    bsf      PORTC,0
    goto     Main

Clear:
    bcf      PORTC,0
    goto     Main
```

Option #2: Get a little tricky with diodes implementing a min function

- Y1: $T > 10C$
- Y2: $T < 15C$
- $Y = \min(Y1, Y2)$

Binary Outputs

4) Design a circuit which allows your PIC board to turn on and off an RGB Piranah LED at 0mA (off) and 10mA (on). Assume the specifications for the LEDs are:

Color	Vf @ 20mA	mcd @ 20mA
red	2.0V	10,000
green	3.2V	10,000
blue	3.2V	10,000

Since this is less than 5V and 25mA, connect directly to a PIC using a resistor

$$R_r = \left(\frac{5V - 2.0V}{10mA} \right) = 300\Omega$$

$$R_g = \left(\frac{5V - 3.2V}{10mA} \right) = 180\Omega$$

$$R_b = \left(\frac{5V - 3.2V}{10mA} \right) = 180\Omega$$

5) Design a circuit which allows your PIC board to turn on and off a 5W LED at 250mA. The specs for the LED are:

- $V_f = 6.0-7.0V$
- Current = 700mA
- 500-600 Lumens (equivalent to a 60W light bulb).

<https://www.ebay.com/itm/1W-3W-5W-10W-50W-100W-High-power-SMD-Chip-LED-COB-White-Blue-Red-Light-Beads/124011607823>

Assume you have a 6144 NPN transistor:

- max continuous current = 3A
- current gain = 300
- $V_{be} = 0.7V$, $V_{ce(sat)} = 0.2V$

Since this is more than a PIC can output, use an NPN transistor as a buffer (switch)

Step 1: Set the current to 250mA

- Assume a 12V power supply

$$R_c = \left(\frac{12V - 6.5V - 0.2V}{250mA} \right) = 21.2\Omega$$

Pick R_c to saturate the transistor

$$\beta I_b > I_c$$

$$300 I_b > 250mA$$

$$I_b > 0.833mA$$

Let $I_b = 4.3mA$ (arbitrary: more than 0.833mA, less than 25mA)

$$R_b = \left(\frac{5V - 0.7V}{4.3mA} \right) = 1k\Omega$$

Timing:

6) Write a program which outputs the music note E4 (329.63 Hz)

- Verify the frequency of the square wave you generate
- (Pano Tuner app on you cell phone works well for this)

First, calculate the number of clocks between toggles

$$N = \left(\frac{10,000,000}{2 \cdot Hz} \right) = 15,168.5223$$

Come up with a wait loop that burns 15,168 clocks

$$N = 10 \cdot A \cdot B + 5 \cdot A + 9 = 15,168$$

$$A = 7, B = 216 \quad (N = 15,164, 0.03\% \text{ low})$$

```
#include <p18f4620.inc>
```

```
; Variables
```

```
CNT0 EQU 1
```

```
CNT1 EQU 2
```

```
; Program
```

```
org 0x800
```

```
call Init
```

```
Loop:
```

```
incf PORTC,F
```

```
call Wait
```

```
goto Loop
```

```
; --- Subroutines ---
```

```
Init:
```

```
clrf TRISA
```

```
clrf TRISB
```

```
clrf TRISC
```

```
clrf TRISD
```

```
clrf TRISE
```

```
movlw 0x0F
```

```
movwf ADCON1 ;everyone is binary
```

```
return
```

```
Wait:
```

```
movlw 7 ; A
```

```
movwf CNT1
```

```
W1:
```

```
movlw 216 ; B
```

```
movwf CNT0
```

```
W0:
```

```
nop ; 10 clocks
```

```
nop
```

```
nop
```

```
nop
```

```
nop
```

```
nop
```

```
nop
```

```
decfsz CNT0, F
```

```
goto W0
```

```
decfsz CNT1, F
```

```
goto W1
```

```
return
```

Result = 330.2Hz

- +0.17% high

Lab: PIC Stoplight

7) Give the flow chart for a program to turn your PIC board into a stoplight

- PORTC = East/West
- PORTD = North/South

	7	6	5	4	3	2	1	0
PORTC (E/W)	-	-	R	R	Y	Y	G	G
PORTD (N/S)	-	-	R	R	Y	Y	G	G

The stoplight cycles every 14 seconds

Duration (seconds)	E/W	N/S
5s	G	R
2s	Y	R
5s	R	G
2s	R	Y

Counting mod 14

Count	E/W	N/S
0	0x03 (green)	0x30 (red)
5	0x0C (yellow)	0x30 (red)
7	0x30 (red)	0x03 (green)
12	0x30 (red)	0x0C (yellow)

8) Write the corresponding assembler code

- Include a routine which waits

```
; --- Stoplight.asm ----

#include <p18f4620.inc>

; Variables

SEC          equ          0
CNT0 equ          1
CNT1 equ          2
CNT2 equ          3
CNT3 equ          4

          org          0x800
          call          Init

L1:          call          Count
          call          Lights
          call          Wait
          goto          L1

Init:          clr          TRISA
          clr          TRISB
          clr          TRISC
          clr          TRISD
          movlw          0x0F
          movwf          ADCON1
          clr          SEC
          return

Count:          incf          SEC,F
          movlw          14
          cpfseq          SEC
          goto          L2
          clr          SEC

L2:          movff          SEC,PORTA
          return

Lights:          movlw          0
          cpfseq          SEC
          goto          L3
          movlw          0x03
          movwf          PORTC
          movlw          0x30
          movwf          PORTD
          return

L3:          movlw          5
          cpfseq          SEC
          goto          L4
          movlw          0x0C
          movwf          PORTC
          movlw          0x30
          movwf          PORTD
          return

L4:          movlw          7
          cpfseq          SEC
          goto          L5
```

```

        movlw    0x30
        movwf    PORTC
        movlw    0x03
        movwf    PORTD
        return

L5:
        movlw    12
        cpfseq   SEC
        goto     L6
        movlw    0x30
        movwf    PORTC
        movlw    0x0C
        movwf    PORTD
        return

L6:
        return

```

```

; One second wait routine
; N = 10ABC + 5AB + 5A + 4
; N = 10,050,504

```

```

Wait:
        movlw    100        ; A
        movwf    CNT2

W2:
        movlw    100        ; B
        movwf    CNT1

W1:
        movlw    100
        movwf    CNT0        ; C

W0:
        nop
        nop
        nop
        nop
        nop
        nop
        nop
        decfsz   CNT0,F
        goto     W0

        decfsz   CNT1,F
        goto     W1

        decfsz   CNT2,F
        goto     W2

        return

end

```

9) Test your code.

- Compile and program your PIC board
- Verify each button's operation

Step #1: Test the wait routine

```
        org      0x800
        call     Init
L1:      incf     PORTC,F
;        call     Count
;        call     Lights
        call     Wait
        goto     L1
```

After fixing the wait routine, PORTC counts every second

Step #2: Test the count mod-12 routine

```
        org      0x800
        call     Init
L1:      call     Count
;        call     Lights
        call     Wait
        goto     L1
```

After fixing more bugs, PORTA counts 0..13 (mod 12)

Step #3: Test the lights routine

```
        org      0x800
        call     Init
L1:      call     Count
        call     Lights
        call     Wait
        goto     L1
```

After a few more bugs, the lights work correctly

10) (20 points) Demonstration

- In-person or with a video

Stoplight Code:

- PORTA = Count (currently at 3 seconds)
- PORTC = E/W (currently green light)
- PORTD = N/S (currently red light)
