## ECE 461/661 Handout \#22

Gain Compensation
The root locus for $\mathrm{G}(\mathrm{s})$ is given below

$$
G(s)=\left(\frac{200}{(s+0.3)(s+2)(s+5)(s+10)}\right)
$$

Determine the gain, k , that results in $20 \%$ overshoot in the step response

| Closed-Loop dominant pole | k | Resulting Kp |
| :---: | :---: | :---: |
|  |  |  |
|  |  |  |

Solution

$$
G(s)=\left(\frac{200}{(s+0.3)(s+2)(s+5)(s+10)}\right)
$$

| Closed-Loop dominant pole | k | Resulting Kp |
| :---: | :---: | :---: |
| $\mathbf{S} \mathbf{= \mathbf { - 0 . 7 0 3 } + \mathbf { j 1 . 4 0 6 }}$ | $\mathbf{0 . 5 9 5}$ | $\mathbf{3 . 6 9 3}$ |
| $\left(\frac{200}{(s+0.3)(s+2)(s+5)(s+10)}\right)_{s=-0.703+j 1.406}=1.682 \angle 180^{0}$ |  |  |
| $k=\frac{1}{1.682}=0.595$ |  |  |
| $K_{p}=(G K)_{s=0}=\left(\frac{200 k}{(s+0.3)(s+2)(s+5)(s+10)}\right)_{s=0}=3.693$ |  |  |
