# **CircuitLab and Matlab**

## **ECE 211 Circuits I**

### **Lecture #0**

Please visit [Bison Academy](#) for corresponding  
lecture notes, homework sets, and solutions

---

---

Circuit design and analysis is usually a three step process:

- First, you design your circuit on paper.
- Next, you simulate your design to make sure it works.
- Then you build your circuit in lab

The tools we'll be using in this class to do this are:

- Matlab: a tool that makes circuit design and analysis much easier. Think of Matlab as a calculator which can solve 50 equations for 50 unknowns and graph the results.
  - CircuitLab: a very friendly circuit simulator which allows you to build a circuit using drag and drop. Once built, you can find the voltages or run a time simulation to see how the voltages change over time (useful for AC analysis).
  - Breadboards, oscilloscopes, and multimeters: used in lab to allow you to connect components together to build a circuit.
-

---

## **CircuitLab ( [www.CircuitLab.com](http://www.CircuitLab.com) )**

- CircuitLab is a circuit simulator
- Very friendly to use
- Fairly intuitive (can jump right in)
- Multiple tutorials on YouTube are available

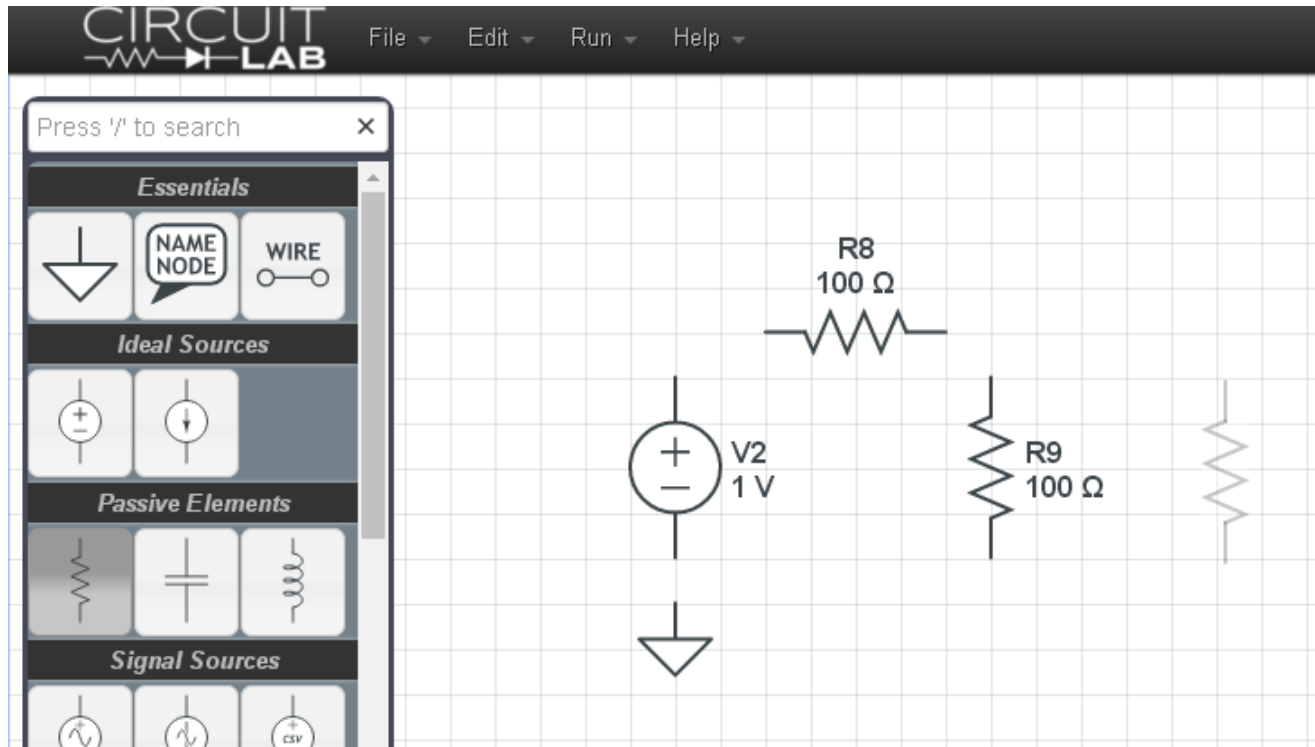

### **Starting Out:**

- Create an account
- Use your NDSU email address and it's free
- NDSU ECE pays of university license
- \$34/year for personal license (2020 prices)

# Starting CircuitLab

To build a circuit, drag and drop components from the left (we'll talk about what each one is later in this course)

- R rotates the component
- Double click to change the value

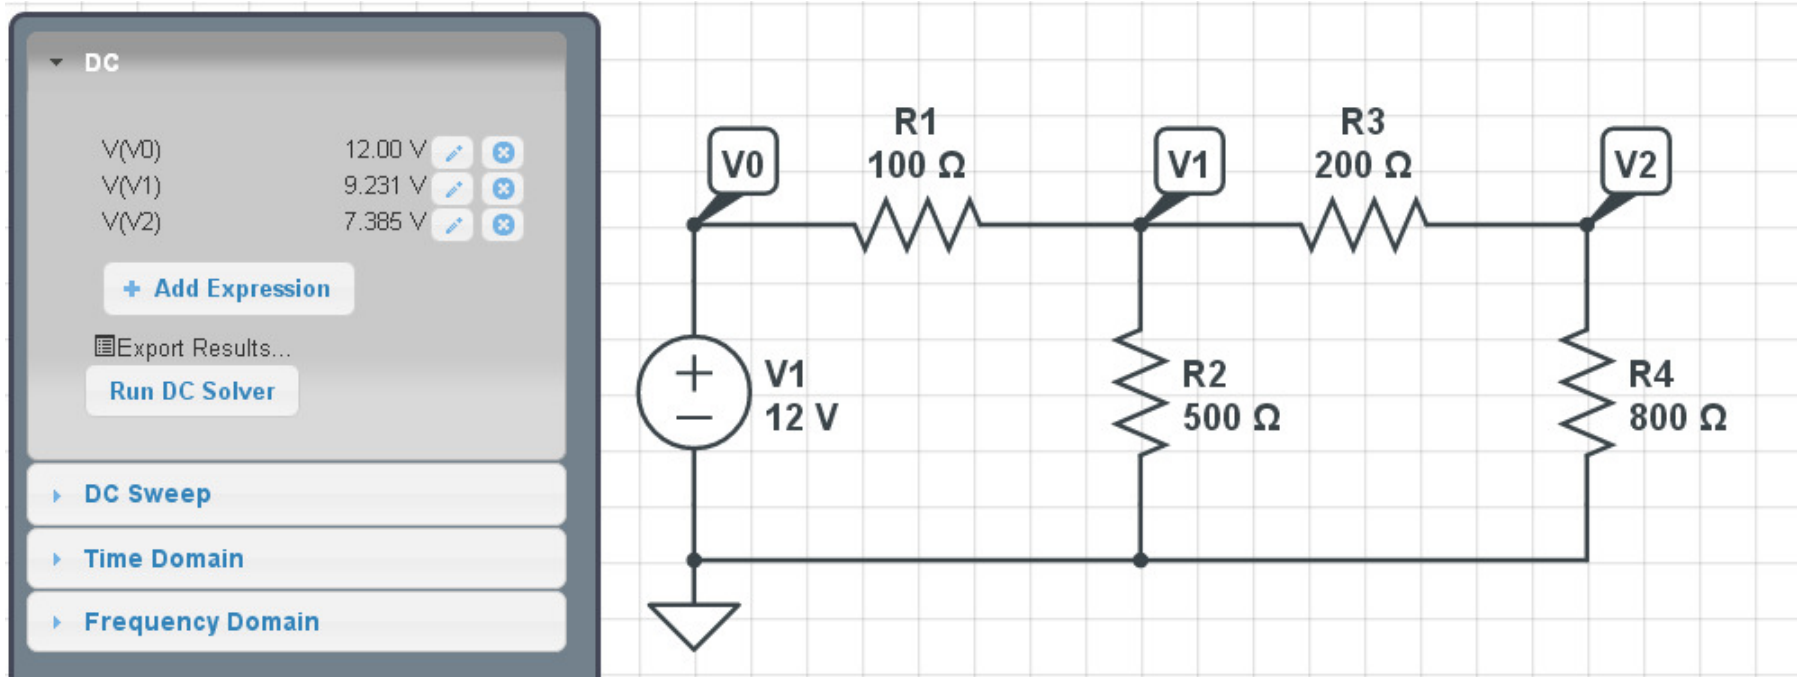

Click and drag to connect the wires together. Adding labels allow you to look at different voltages

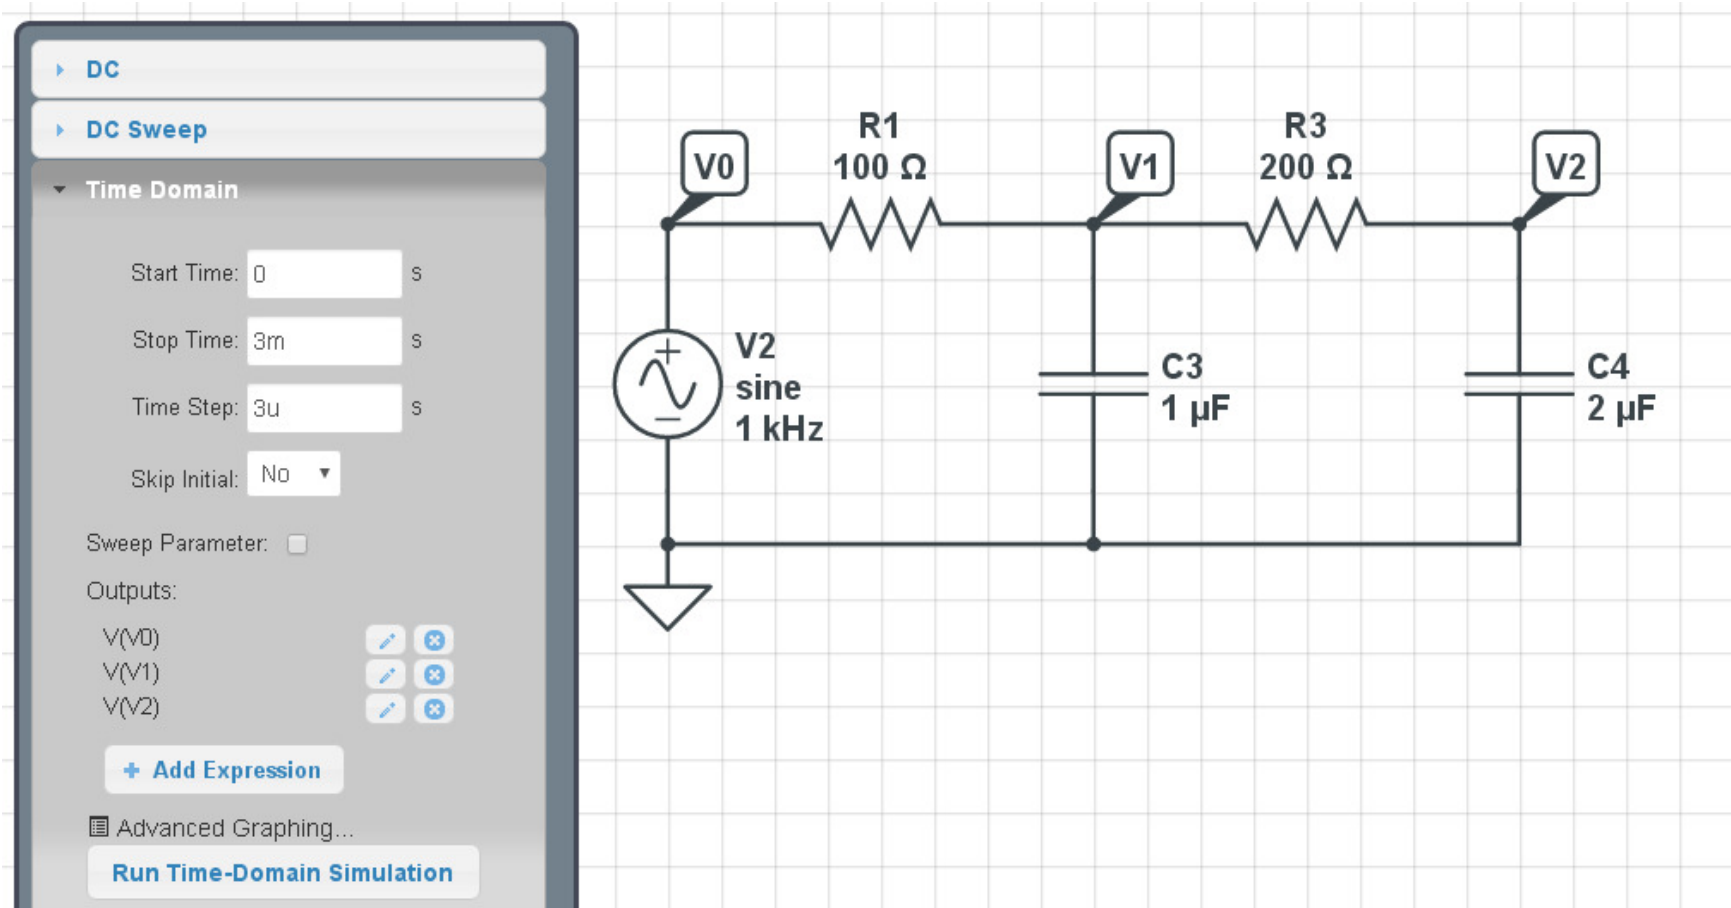

To find the voltages, click on

- Simulate
- + Add Expression ( Select V0, V1, and V2 )
- Run DC Solver
- Voltages should match what you calculated with Matlab and measured in lab

You can also look at transient simulation. Change the source to an AC signal and change R2 and R4 to capacitors

---

## Now run a Timer Domain simulation

- The input is a 1kHz sine wave. Run the simulation for a few cycles (3 cycles or 3ms)
- Make the time step 100 to 1000x smaller ( 3 $\mu$ s gives 1000 points on the following graph). If you make the time step too small, it will take some time to finish the simulation.
- + Add expression to see V0, V1, and V2
- Click on Run Time Domain Simulation
- Should be the same as you measure in lab with an oscilloscope

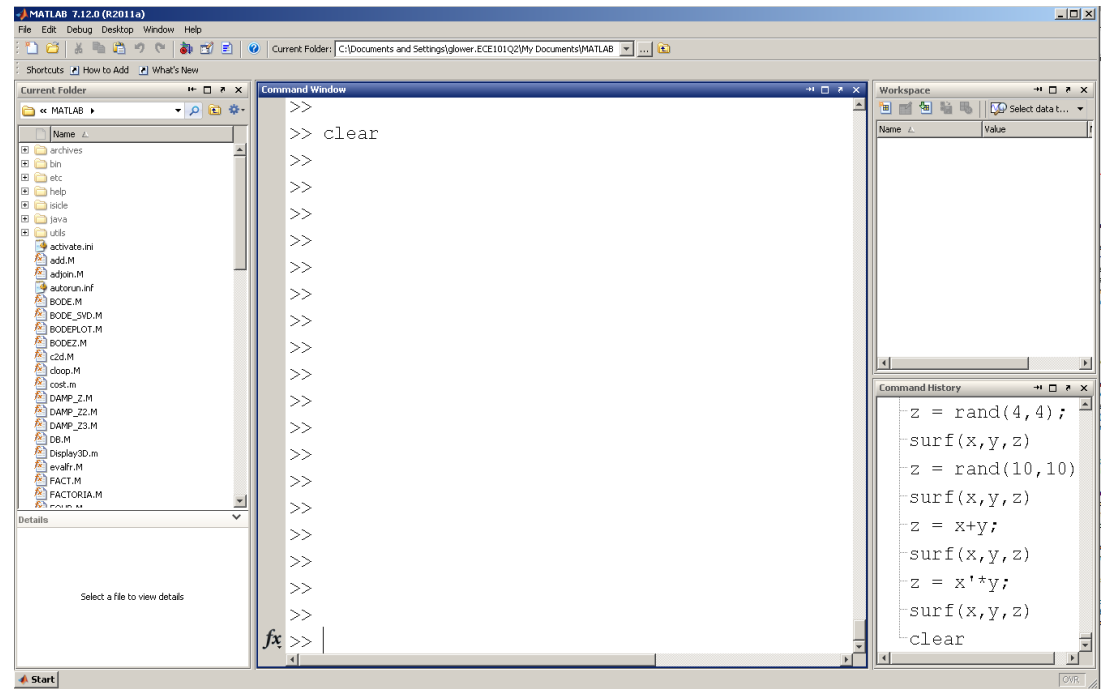

# Introduction to Matlab

## Becoming familiar with MATLAB

- The console
- The editor
- Scripts
- Functions
- Graphics Window

# General environment and the console

When you start up Matlab, you get several windows

*I usually close everything doen except the command window.*

The command window is like a calculator:

```
>> (2 + 3) * 5
```

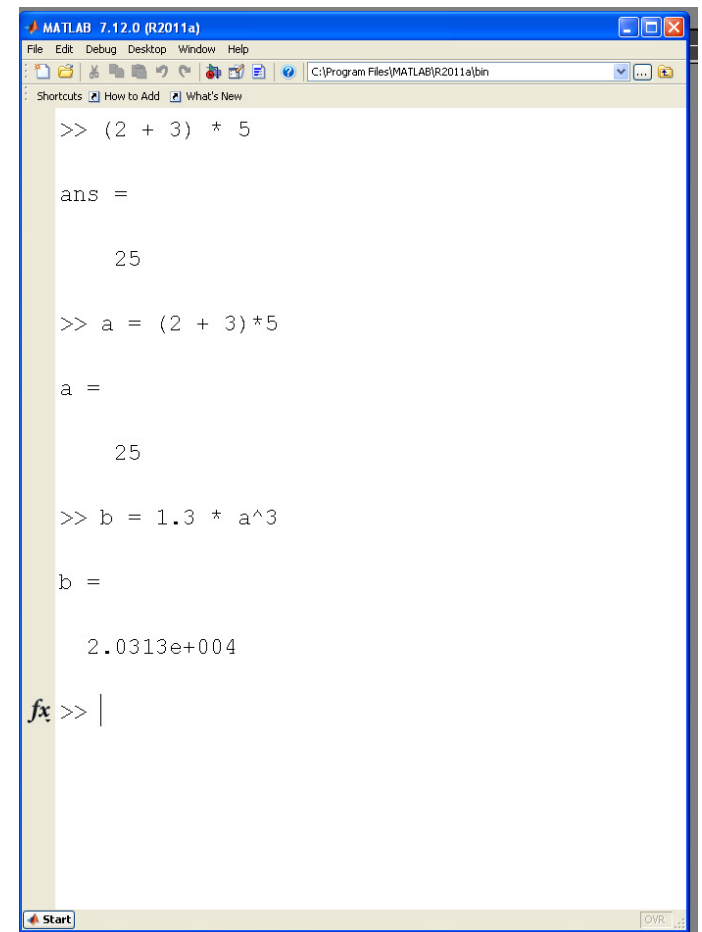

```
ans =    25
```

```
>> a = (2+3) * 5
```

```
a =    25
```

```
>> b = 1.3 * a^3
```

```
b = 2.0313e+004
```

# Matrices in Matlab

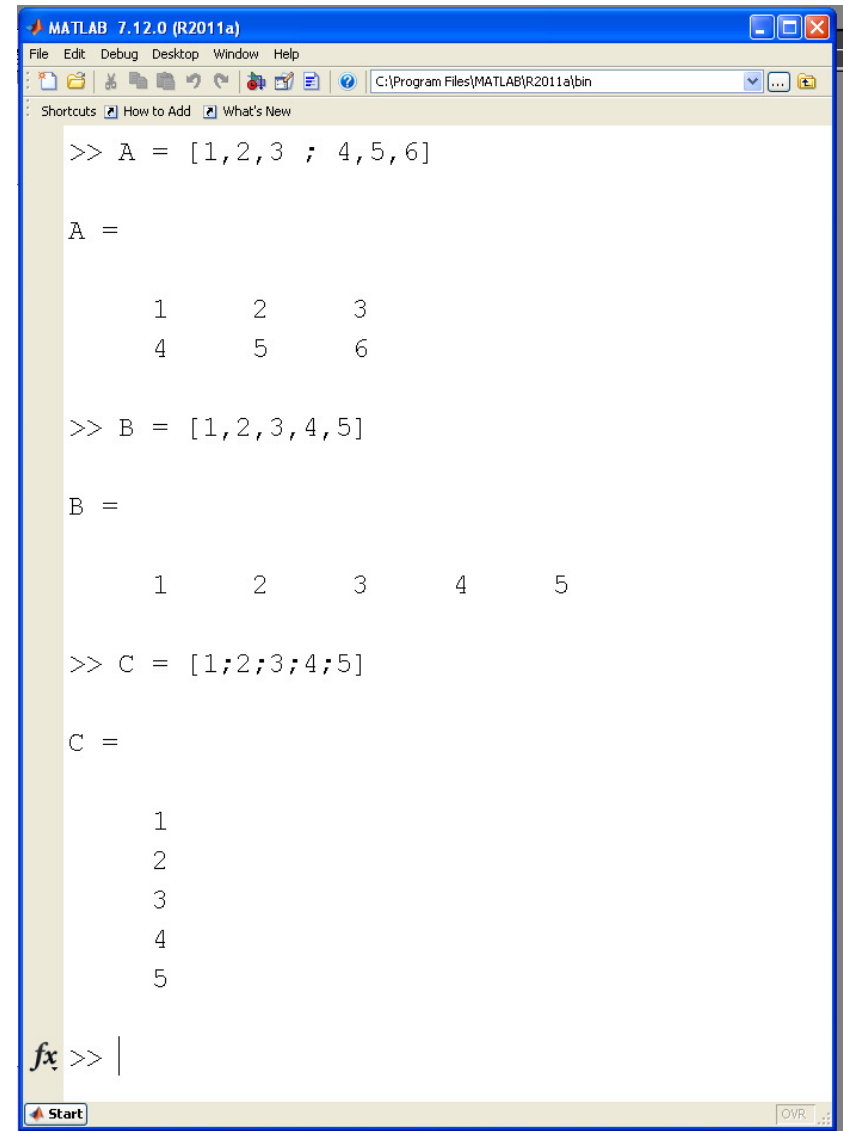

The syntax to input a matrix are:

[	start of a matrix
,	next column (a space also works)
;	next row
]	end of matrix.

Example:

```
A = [1,2,3 ; 4,5,6]
```

1	2	3
4	5	6

The screenshot shows the MATLAB 7.12.0 (R2011a) command window. The title bar indicates the version and release. The menu bar includes File, Edit, Debug, Desktop, Window, and Help. The toolbar contains icons for file operations and execution. The command window shows the following commands and their outputs:

```
>> A = [1,2,3 ; 4,5,6]
```

A =

1	2	3
4	5	6

```
>> B = [1,2,3,4,5]
```

B =

1	2	3	4	5
---	---	---	---	---

```
>> C = [1;2;3;4;5]
```

C =

1
2
3
4
5

The command window also shows a 'fx' icon and a 'Start' button at the bottom left.

# Matrix Operations

## Addition & Multiplication:

- Dimensions have to be the same

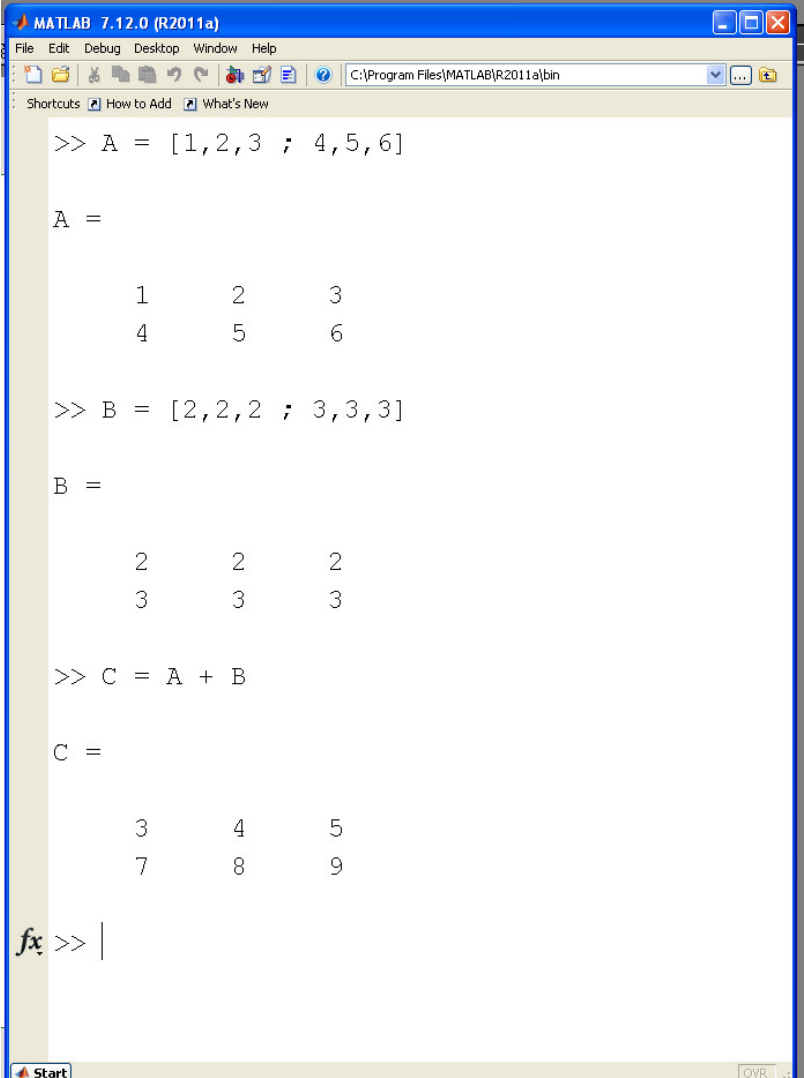

## Multiplication:

- Inner dimensions must match

## Matrix Inverse

- Needs to be an NxN matrix

Error message if not

The image shows a screenshot of the MATLAB 7.12.0 (R2011a) command window. The window has a blue title bar and a menu bar with options: File, Edit, Debug, Desktop, Window, Help. Below the menu bar is a toolbar with various icons. The main area of the window is a white text box where commands are entered and results are displayed. The commands and their outputs are as follows:

```
>> A = [1,2,3 ; 4,5,6]

A =

     1     2     3
     4     5     6

>> B = [2,2,2 ; 3,3,3]

B =

     2     2     2
     3     3     3

>> C = A + B

C =

     3     4     5
     7     8     9

fx >> |
```

The window also shows a Windows taskbar at the bottom with the Start button and a clock showing 10:00 AM on 10/10/2011.

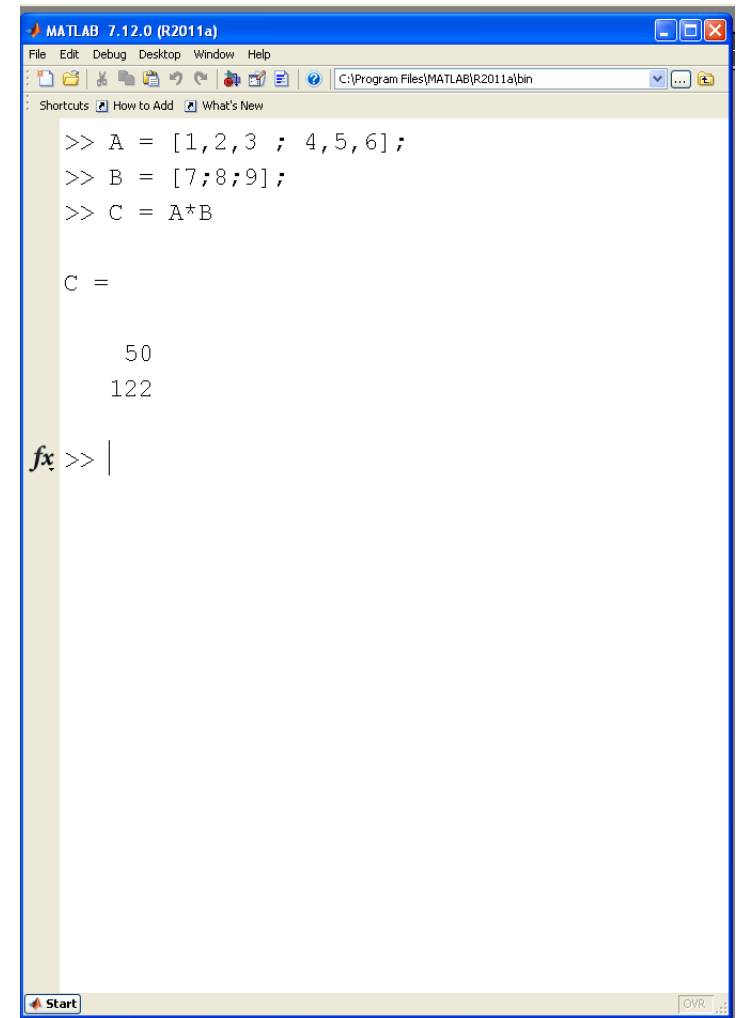

## Semi-Colon

- Exclude: Evaluate and display the result
- Include: Evaluate and do *not* display the result

When debugging my code, I usually remove semi-colons

- Check that the code is working correctly

Once it works, insert semi-colons

# Display Settings

```
format short  
pi
```

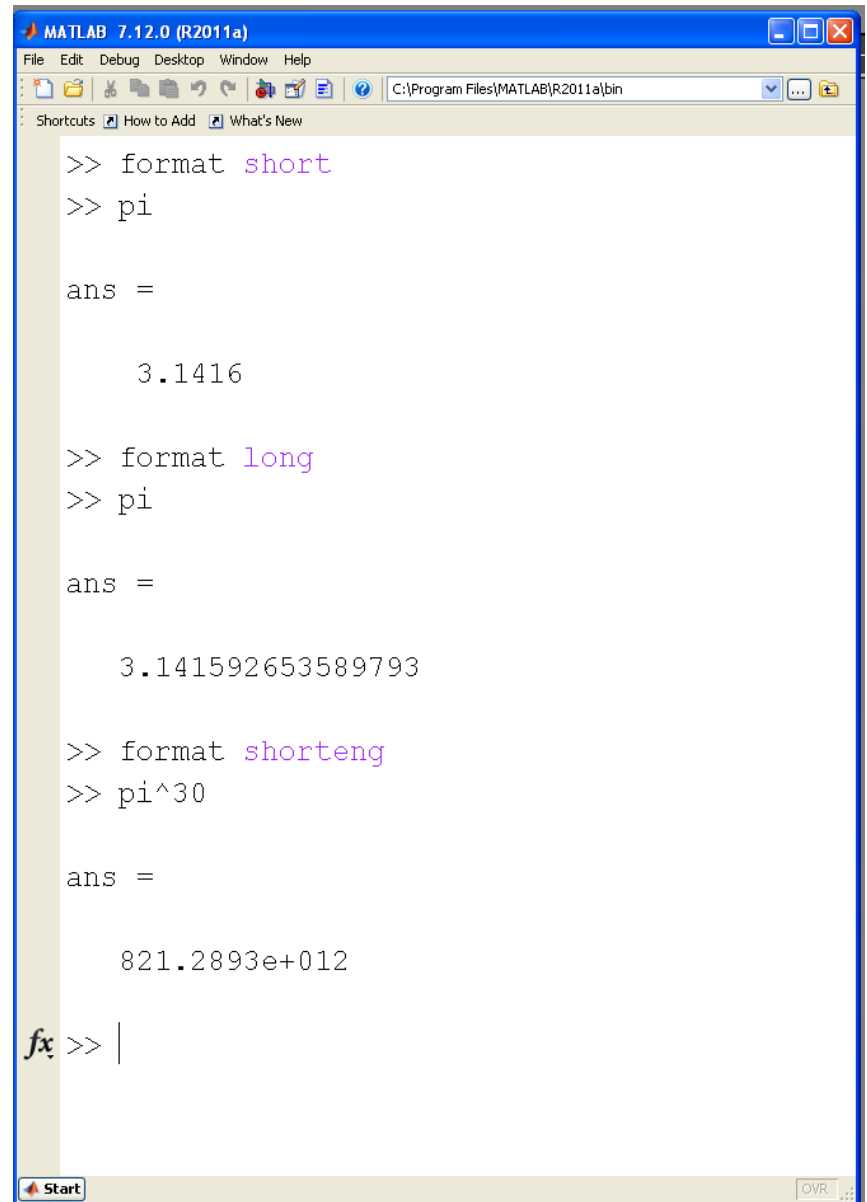

3.1416

```
format long  
pi
```

3.141592653589793

```
format shorteng  
pi^30
```

821.2893e+012

A screenshot of the MATLAB 7.12.0 (R2011a) command window. The window has a blue title bar and a menu bar with File, Edit, Debug, Desktop, Window, and Help. Below the menu bar is a toolbar with various icons. The main area of the window is white and contains the following text: 

```
>> format short  
>> pi  
  
ans =  
  
    3.1416  
  
>> format long  
>> pi  
  
ans =  
  
    3.141592653589793  
  
>> format shorteng  
>> pi^30  
  
ans =  
  
    821.2893e+012  
  
fx >> |
```

 The window also shows a status bar at the bottom with a Start button and an OVR indicator.

## for loops:

```
x = zeros(1,5);  
for i=1:5  
    x(i) = i*i;  
end
```

```
x =      1      4      9     16     25
```

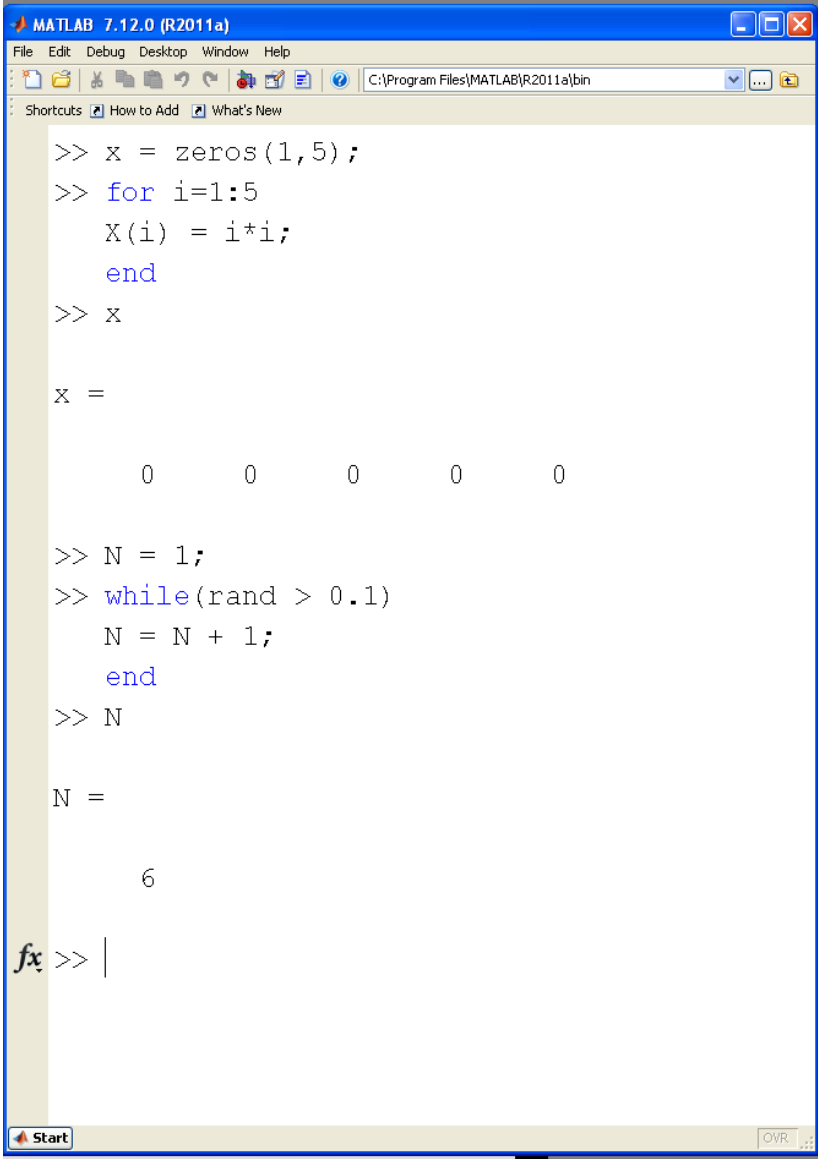

## while loop

```
N = 1;  
while(rand > 0.1)  
    N = N + 1;  
end
```

```
N = 6
```

## if - if else end

```
if(rand < 0.1)  
    die = 6;  
else  
    die = ceil( 6*rand );  
end
```

The image shows a MATLAB 7.12.0 (R2011a) window with the following code and output:

```
>> x = zeros(1,5);  
>> for i=1:5  
    X(i) = i*i;  
end  
>> x  
  
x =  
  
      0      0      0      0      0  
  
>> N = 1;  
>> while(rand > 0.1)  
    N = N + 1;  
end  
>> N  
  
N =  
  
      6  
  
fx >> |
```

---

## Scripts and Functions in Matlab

Matlab is also a programming language. This allows you to run the same code over and over without having to constantly retyping in the code over and over again.

- Scripts are like code you type in the command window. When you run a script, it is like you just typed in the code in the script in the command window
- Functions are subroutines. They allow you to create new commands in Matlab which can be called by other new functions and so on.

This is why Matlab is used by industry so much: you can create a library of functions and scripts which allow you to design your product.

---

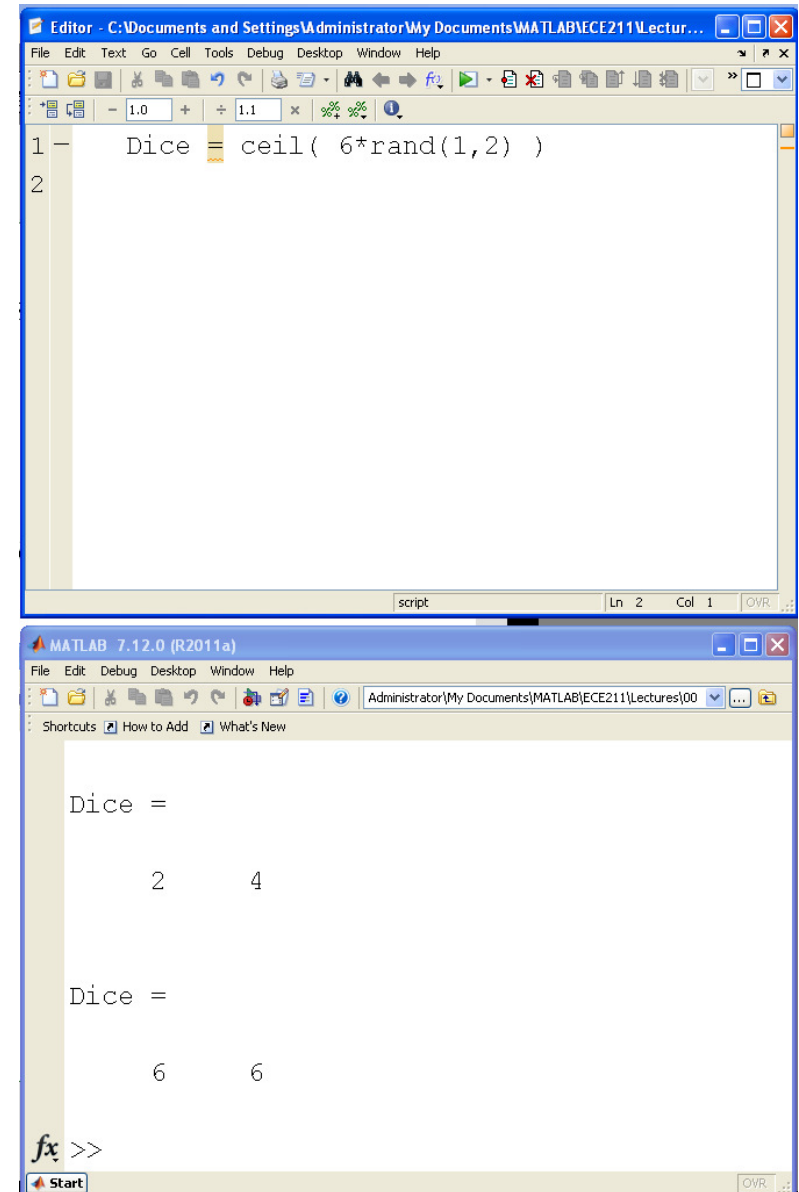

# Scripts:

Suppose you want to see the distribution of rolling two six-sided dice (2d6) 100 times. This is where scripts shine.

- Start with a New Script.
- Get the code to produce 2 random numbers
- Click on the green arrow to run the script (F5)

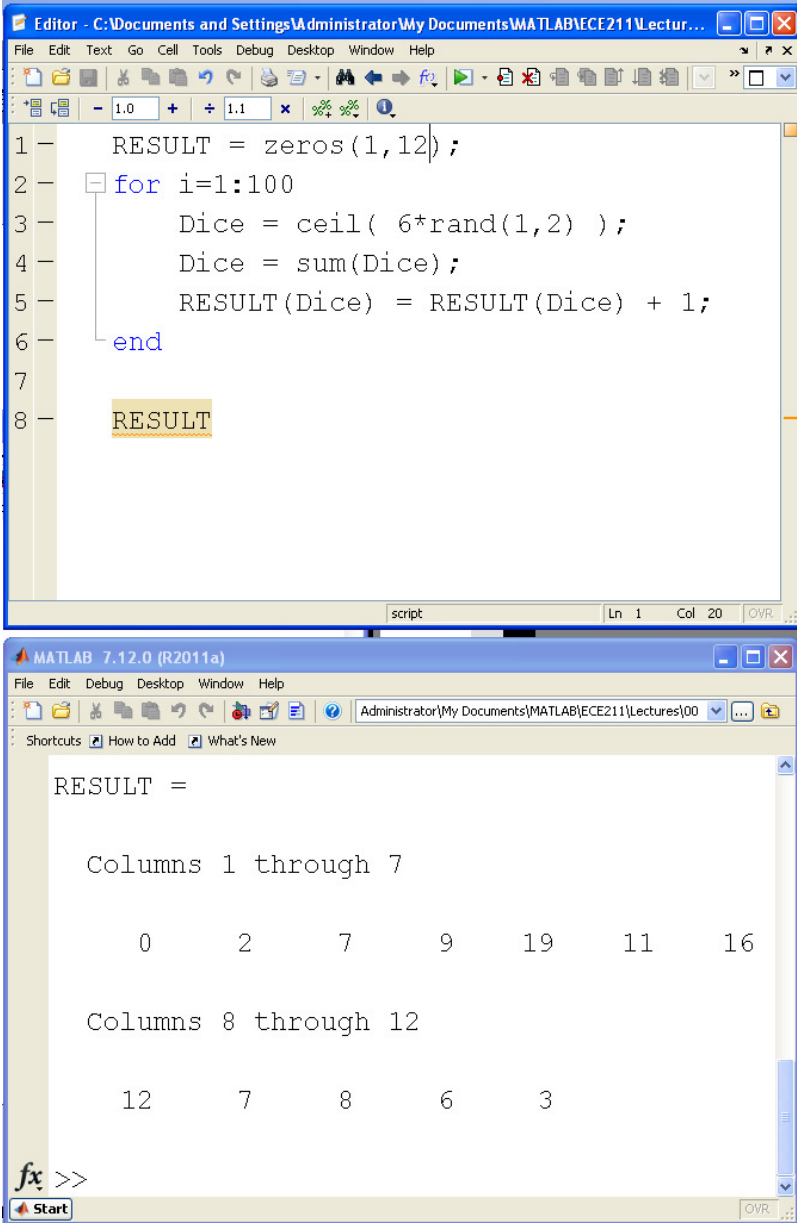

note: Save the script in the Matlab directory. If you save it somewhere else on your computer, Matlab won't be able to find it.

Once you are convinced the script works,

- Get it to sum the two dice
- Then repeat 100 times

This determines the frequency of rolling each number when rolling the dice 100 times

The image shows two windows from the MATLAB 7.12.0 (R2011a) environment. The top window is the MATLAB Editor, showing a script file named 'script'. The script contains the following code:

```
1 RESULT = zeros(1,12);  
2 for i=1:100  
3     Dice = ceil( 6*rand(1,2) );  
4     Dice = sum(Dice);  
5     RESULT(Dice) = RESULT(Dice) + 1;  
6 end  
7  
8 RESULT
```

The bottom window is the MATLAB Command Window, showing the output of the script. It displays the 'RESULT' vector, which is a 1x12 array. The output is formatted as follows:

RESULT =

Columns 1 through 7

0	2	7	9	19	11	16
---	---	---	---	----	----	----

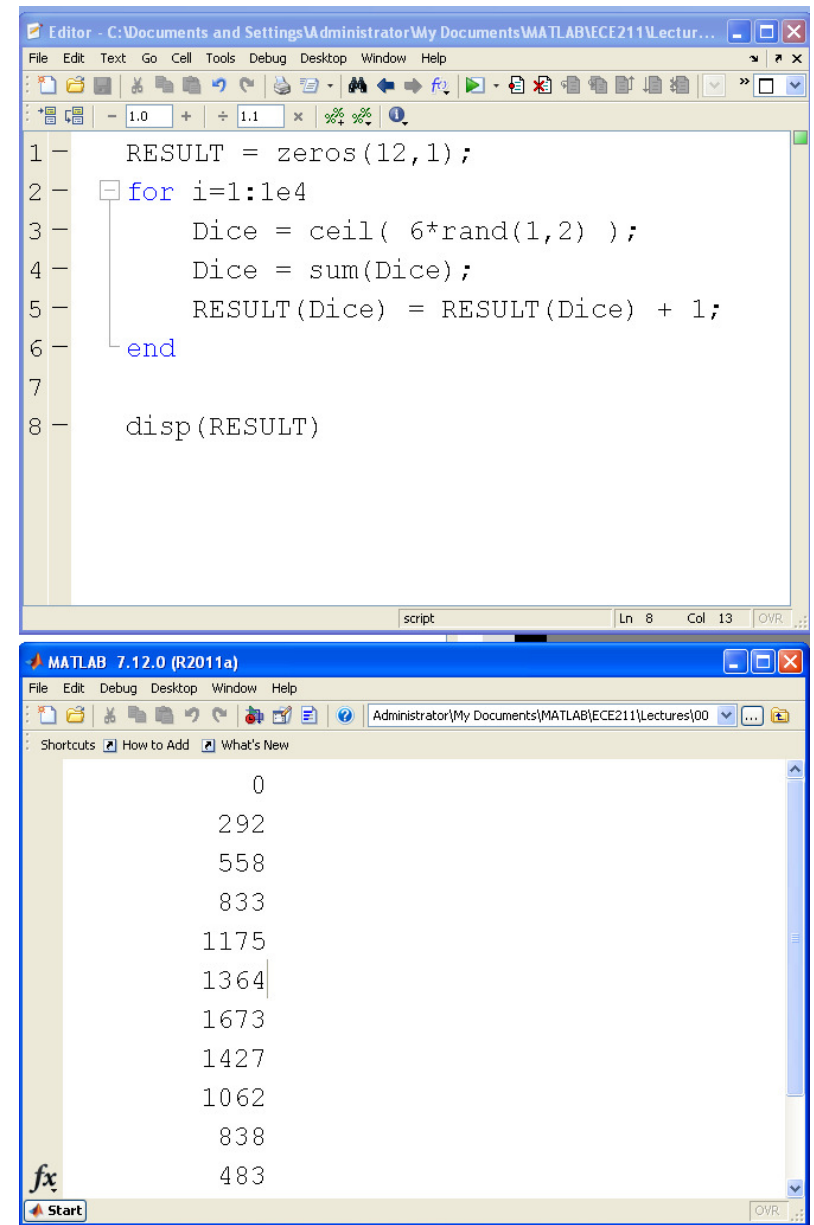

Columns 8 through 12

12	7	8	6	3
----	---	---	---	---

fx >>  
Start

## The beauty of scripts is that

- If you want to see what happens if you run it a second time, you can just by clicking the green arrow again.
- If you want to roll the dice 1000 times instead, change one line of code ( `i = 1:100` becomes `1:1000` )

The image shows two windows from the MATLAB 7.12.0 (R2011a) environment. The top window is the MATLAB Editor, displaying a script named 'script.m'. The script initializes a 12x1 zero vector 'RESULT', then enters a 'for' loop from `i=1` to `1e4` (10,000). Inside the loop, it generates a random number between 1 and 2, multiplies it by 6, and uses the `ceil` function to get a value between 1 and 12. This value is then added to the corresponding index in the 'RESULT' vector. After the loop, the contents of 'RESULT' are displayed. The bottom window is the MATLAB Command Window, showing the output of the script: a column vector of 10,000 values representing the results of the dice rolls. The values are mostly between 1 and 12, with some values like 292, 558, 833, 1175, 1364, 1673, 1427, 1062, 838, and 483 appearing more frequently than others, illustrating the distribution of the rolls.

```
1 RESULT = zeros(12,1);  
2 for i=1:1e4  
3     Dice = ceil( 6*rand(1,2) );  
4     Dice = sum(Dice);  
5     RESULT(Dice) = RESULT(Dice) + 1;  
6 end  
7  
8 disp(RESULT)
```

0  
292  
558  
833  
1175  
1364  
1673  
1427  
1062  
838  
483

# Functions

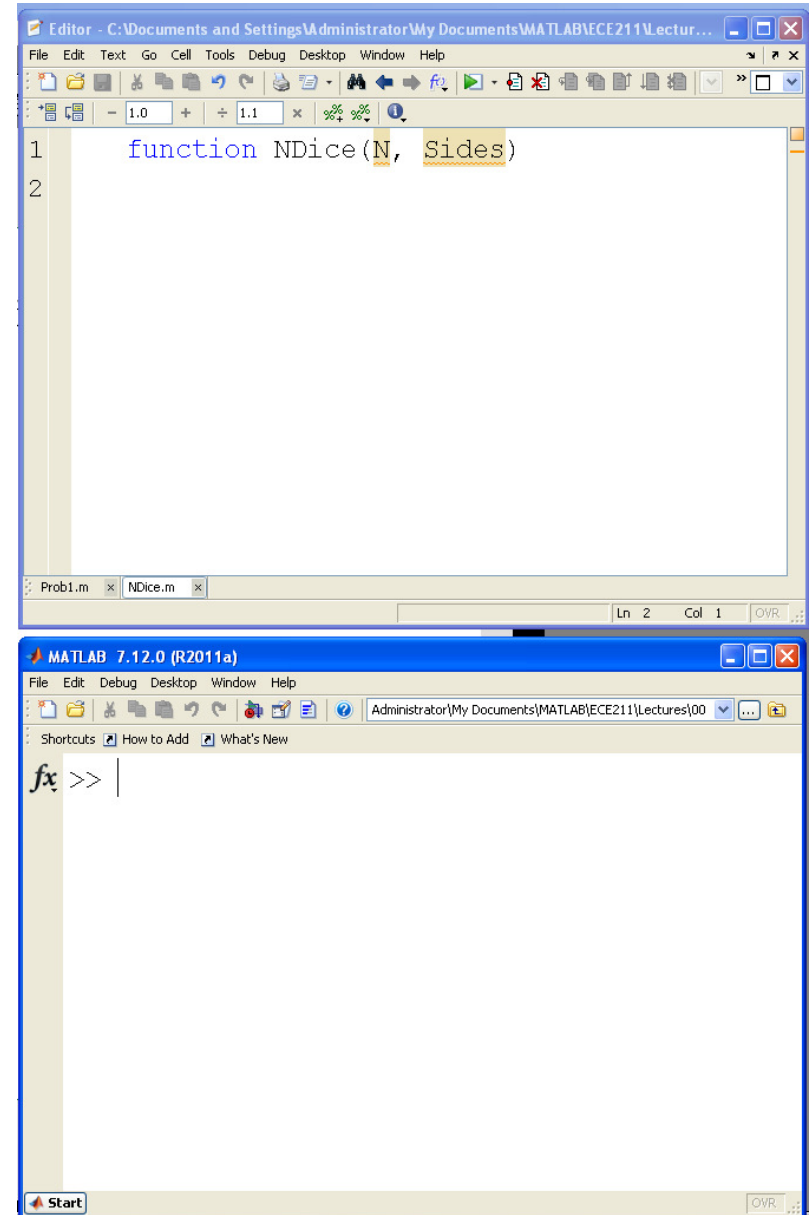

A function is a subroutine. It allows you to create new functions in Matlab that can be used over and over again.

For example, let's create a function called NDice. It will be passed two parameters

- N: The number of dice
- Sides: The range of numbers (1..6, 1..12, etc.)

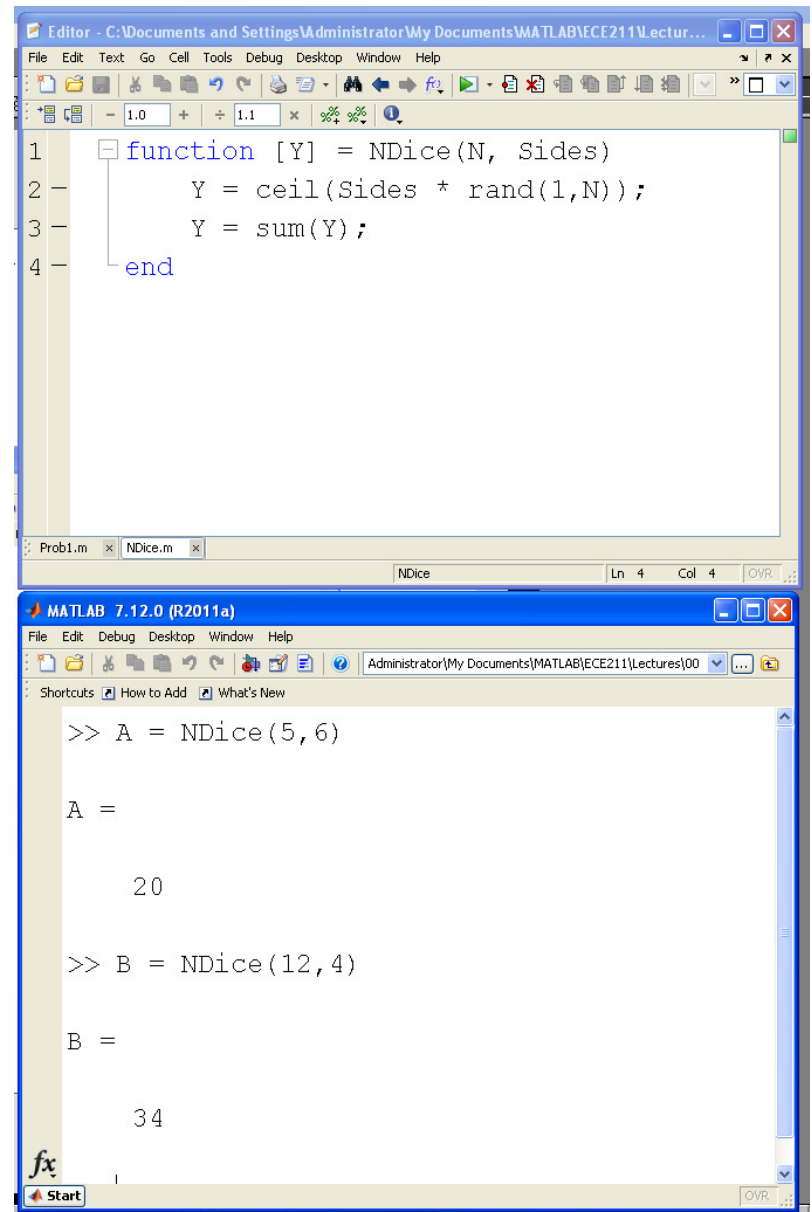

In Matlab,

- click on New Function
- Create the subroutine
- Save with the same name as the function

With that you just created a new function in Matlab called NDice. From the command window, you can

- Find the sum of rolling 5d6 (total is 18)
- Find the sum of rolling 12d4 (total is 26)

The screenshot displays two windows from the MATLAB 7.12.0 (R2011a) environment. The top window, titled 'Editor - C:\Documents and Settings\Administrator\My Documents\MATLAB\ECE211\Lectur...', shows the source code for a function named 'NDice'. The code is as follows:

```
1 function [Y] = NDice(N, Sides)
2     Y = ceil(Sides * rand(1,N));
3     Y = sum(Y);
4 end
```

The bottom window, titled 'MATLAB 7.12.0 (R2011a)', shows the Command Window with the following interactions:

```
>> A = NDice(5,6)

A =

    20

>> B = NDice(12,4)

B =

    34
```

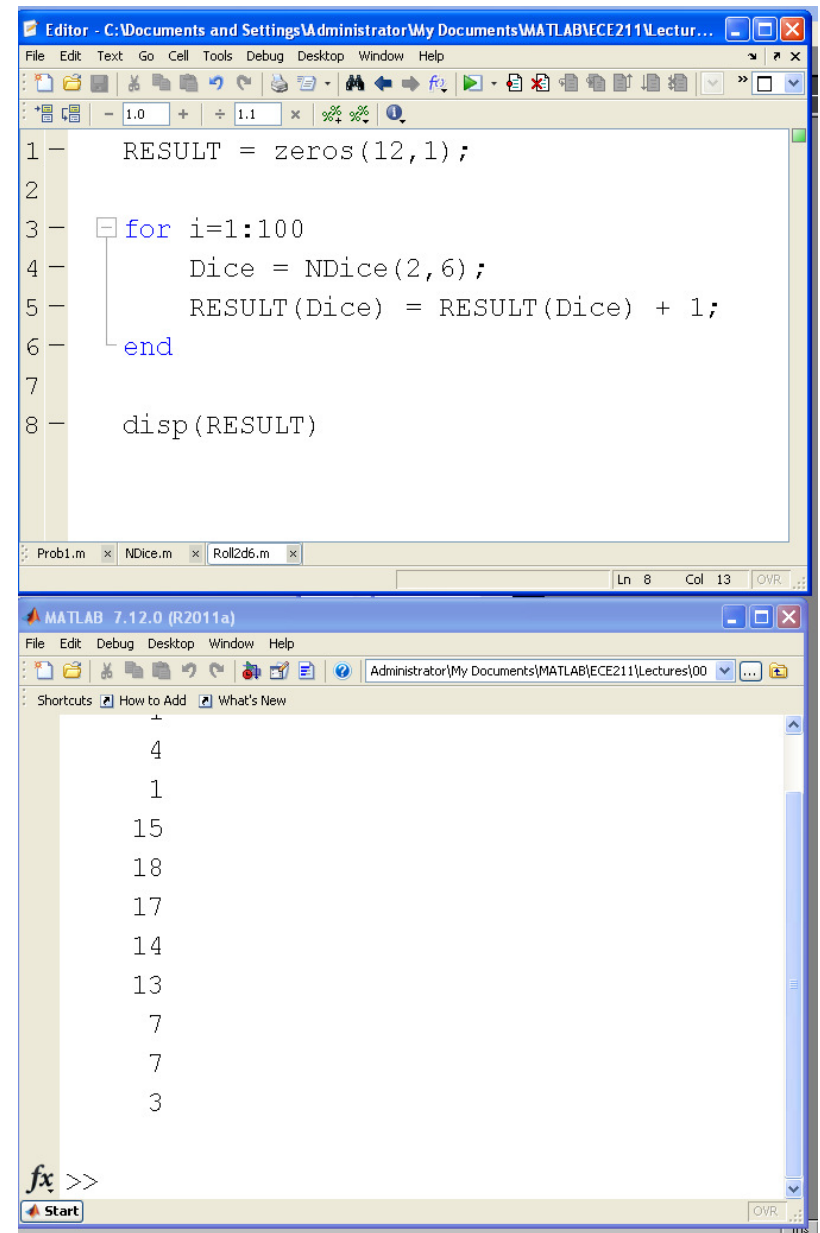

The Command Window also shows a 'Start' button and a status bar with 'OVR' and 'Ln 4 Col 4'.

# Nested Subroutines

- Subroutines can use other subroutines

Now that you have this function, you can clean up the script

- Note that since this script uses a function we just create, other people won't be able to run this script unless they too create the function NDice.

The image shows two windows from the MATLAB 7.12.0 (R2011a) environment. The top window is the Editor, showing a script with the following code:

```
1  RESULT = zeros(12,1);  
2  
3  for i=1:100  
4      Dice = NDice(2,6);  
5      RESULT(Dice) = RESULT(Dice) + 1;  
6  end  
7  
8  disp(RESULT)
```

The bottom window is the Command Window, showing the output of the script as a column vector:

```
4  
1  
15  
18  
17  
14  
13  
7  
7  
3
```

The Command Window also shows the MATLAB prompt `fx >>` and a `Start` button at the bottom.

---

# Plotting Functions in Matlab:

Matlab has some pretty good graphics capabilities.

Matlab Plot Command	x axis	y axis	type of function
plot(x,y)	linear	linear	$y = ax + b$
semilogx(x,y)	log()	linear	$y = a \cdot e^{bx}$
semilogy(x,y)	linear	log()	$y = a + b \ln(x)$
loglog(x,y)	log()	log()	$y = a \cdot b^x$
subplot(abc)	Create 'a' rows, 'b' columns of graphs. Starting at #c		

For example, plot the function

$$y = 3x + 4$$

```
x = [0:1:10]';  
y = 3*x + 4;
```

```
% connect the points with a line  
subplot(311)  
plot(x,y);
```

```
% plot a dot at each point  
subplot(312)  
plot(x,y, '.');
```

```
% connect the points and add a dot  
subplot(313);  
plot(x,y, '-');
```

---

## Snipping Tool & Homework Sets

A good way to do the homework in this class is to use MS Word

- Copy and paste your Matlab code in to MS Word
- Delete your mistakes (makes it look like the homework was easy)

For figures, use Snipping Tool

- From Windows, search for Snipping
- Run the snipping tool
- Select the figure you want to use
- Copy and paste it into your MS Word document

When done, submit your Word document on BlackBoard

- .doc file
  - pdf file also works
-

---

## Summary:

CircuitLab is a very friendly circuit simulator

- Drag and Drop
- Easy way to check your analysis in this and other classes
- Free for all NDSU students

Matlab is a really useful tool

- You'll be using it in many courses at NDSU
- You'll probably use it when you go to industry
- Think of it as a calculator on steroids
- Free for all NDSU students

We'll be using both a lot in Circuits I

- If your calculations match CircuitLab's results, you probably did the problem correctly
-
